B-65285EN/04

- No part of this manual may be reproduced in any form.
- All specifications and designs are subject to change without notice.

The products in this manual are controlled based on Japan's "Foreign Exchange and Foreign Trade Law". The export from Japan may be subject to an export license by the government of Japan.

Further, re-export to another country may be subject to the license of the government of the country from where the product is re-exported. Furthermore, the product may also be controlled by re-export regulations of the United States government.

Should you wish to export or re-export these products, please contact FANUC for advice.

In this manual we have tried as much as possible to describe all the various matters. However, we cannot describe all the matters which must not be done, or which cannot be done, because there are so many possibilities. Therefore, matters which are not especially described as possible in this manual should be regarded as "impossible".

- If operation is abnormal, for example, when an alarm is issued or a hardware failure occurs, the operation described in this manual is not guaranteed unless otherwise specifically noted. If operation is abnormal, take action according to the instructions specifically described in this manual if any or contact FANUC when the instructions are not described.
- Generally, a "safety function" means a function that protects the operators from danger posed by the machine.
The signals and functions described in this manual cannot be used separately for any "safety function" unless otherwise described as being [usable for the safety function]. Their specifications are not assumed to be used as the [safety function] in this case, unexpected danger may be caused. If you have any questions, contact FANUC.
- A device connection error or setting error can lead to unpredictable operation. When starting to operate the machine for the first time after assembling the machine, replacing parts, or changing parameter settings, exercise extreme care.

If you have a controller labeled R-J3iC, you should read R-J3iC as R-30iA.

Copyrights and Trademarks

This new publication contains proprietary information of FANUC America Corporation furnished for customer use only. No other uses are authorized without the express written permission of FANUC America Corporation.

The descriptions and specifications contained in this manual were in effect at the time this manual was approved for printing. FANUC America Corporation, hereinafter referred to as FANUC, reserves the right to discontinue models at any time or to change specifications or design without notice and without incurring obligations.

FANUC manuals present descriptions, specifications, drawings, schematics, bills of material, parts, connections and/or procedures for installing, disassembling, connecting, operating and programming FANUC products and/or systems. Such systems consist of robots, extended axes, robot controllers, application software, the KAREL® programming language, INSIGHT® vision equipment, and special tools.

FANUC recommends that only persons who have been trained in one or more approved FANUC Training Course(s) be permitted to install, operate, use, perform procedures on, repair, and/or maintain FANUC products and/or systems and their respective components. Approved training necessitates that the courses selected be relevant to the type of system installed and application performed at the customer site.

⚠ WARNING

This equipment generates, uses, and can radiate radiofrequency energy and if not installed and used in accordance with the instruction manual, may cause interference to radio communications. As temporarily permitted by regulation, it has not been tested for compliance with the limits for Class A computing devices pursuant to subpart J of Part 15 of FCC Rules, which are designed to provide reasonable protection against such interference. Operation of the equipment in a residential area is likely to cause interference, in which case the user, at his own expense, will be required to take whatever measure may be required to correct the interference.

FANUC conducts courses on its systems and products on a regularly scheduled basis at the company's world headquarters in Rochester Hills, Michigan. For additional information contact

FANUC America Corporation
Training Department

WARNING

Information appearing under the "WARNING" caption concerns the protection of personnel. It is boxed and bolded to set it apart from the surrounding text.

CAUTION

Information appearing under the "CAUTION" caption concerns the protection of equipment, software, and data. It is boxed and bolded to set it apart from the surrounding text.

Note Information appearing next to NOTE concerns related information or useful hints.

Safety

FANUC Robotics is not and does not represent itself as an expert in safety systems, safety equipment, or the specific safety aspects of your company and/or its work force. It is the responsibility of the owner, employer, or user to take all necessary steps to guarantee the safety of all personnel in the workplace.

The appropriate level of safety for your application and installation can be best determined by safety system professionals. FANUC Robotics therefore, recommends that each customer consult with such professionals in order to provide a workplace that allows for the safe application, use, and operation of FANUC Robotics systems.

According to the industry standard ANSI/RIA R15-06, the owner or user is advised to consult the standards to ensure compliance with its requests for Robotics System design, usability, operation, maintenance, and service. Additionally, as the owner, employer, or user of a robotic system, it is your responsibility to arrange for the training of the operator of a robot system to recognize and respond to known hazards associated with your robotic system and to be aware of the recommended operating procedures for your particular application and robot installation.

Ensure that the robot being used is appropriate for the application. Robots used in classified (hazardous) locations must be certified for this use.

FANUC Robotics therefore, recommends that all personnel who intend to operate, program, repair, or otherwise use the robotics system be trained in an approved FANUC Robotics training course and become familiar with the proper operation of the system. Persons responsible for programming the system—including the design, implementation, and debugging of application programs—must be familiar with the recommended programming procedures for your application and robot installation.

The following guidelines are provided to emphasize the importance of safety in the workplace.

CONSIDERING SAFETY FOR YOUR ROBOT INSTALLATION

Safety is essential whenever robots are used. Keep in mind the following factors with regard to safety:

- The safety of people and equipment
- Use of safety enhancing devices
- Techniques for safe teaching and manual operation of the robot(s)
- Techniques for safe automatic operation of the robot(s)
- Regular scheduled inspection of the robot and workcell
- Proper maintenance of the robot

Keeping People Safe

The safety of people is always of primary importance in any situation. When applying safety measures to your robotic system, consider the following:

- External devices
- Robot(s)
- Tooling
- Workpiece

Using Safety Enhancing Devices

Always give appropriate attention to the work area that surrounds the robot. The safety of the work area can be enhanced by the installation of some or all of the following devices:

- Safety fences, barriers, or chains
- Light curtains
- Interlocks
- Pressure mats
- Floor markings
- Warning lights
- Mechanical stops
- EMERGENCY STOP buttons
- DEADMAN switches

Setting Up a Safe Workcell

A safe workcell is essential to protect people and equipment. Observe the following guidelines to ensure that the workcell is set up safely. These suggestions are intended to supplement and not replace existing federal, state, and local laws, regulations, and guidelines that pertain to safety.

- Sponsor your personnel for training in approved FANUC Robotics training course(s) related to your application. Never permit untrained personnel to operate the robots.
- Install a lockout device that uses an access code to prevent unauthorized persons from operating the robot.
- Use anti-tie-down logic to prevent the operator from bypassing safety measures.
- Arrange the workcell so the operator faces the workcell and can see what is going on inside the cell.
- Clearly identify the work envelope of each robot in the system with floor markings, signs, and special barriers. The work envelope is the area defined by the maximum motion range of the robot, including any tooling attached to the wrist flange that extend this range.
- Position all controllers outside the robot work envelope.

Safety

- Never rely on software or firmware based controllers as the primary safety element unless they comply with applicable current robot safety standards.
- Mount an adequate number of EMERGENCY STOP buttons or switches within easy reach of the operator and at critical points inside and around the outside of the workcell.
- Install flashing lights and/or audible warning devices that activate whenever the robot is operating, that is, whenever power is applied to the servo drive system. Audible warning devices shall exceed the ambient noise level at the end-use application.
- Wherever possible, install safety fences to protect against unauthorized entry by personnel into the work envelope.
- Install special guarding that prevents the operator from reaching into restricted areas of the work envelope.
- Use interlocks.
- Use presence or proximity sensing devices such as light curtains, mats, and capacitance and vision systems to enhance safety.
- Periodically check the safety joints or safety clutches that can be optionally installed between the robot wrist flange and tooling. If the tooling strikes an object, these devices dislodge, remove power from the system, and help to minimize damage to the tooling and robot.
- Make sure all external devices are properly filtered, grounded, shielded, and suppressed to prevent hazardous motion due to the effects of electro-magnetic interference (EMI), radio frequency interference (RFI), and electro-static discharge (ESD).
- Make provisions for power lockout/tagout at the controller.
- Eliminate *pinch points*. Pinch points are areas where personnel could get trapped between a moving robot and other equipment.
- Provide enough room inside the workcell to permit personnel to teach the robot and perform maintenance safely.
- Program the robot to load and unload material safely.
- If high voltage electrostatics are present, be sure to provide appropriate interlocks, warning, and beacons.
- If materials are being applied at dangerously high pressure, provide electrical interlocks for lockout of material flow and pressure.

Staying Safe While Teaching or Manually Operating the Robot

Advise all personnel who must teach the robot or otherwise manually operate the robot to observe the following rules:

- Never wear watches, rings, neckties, scarves, or loose clothing that could get caught in moving machinery.
- Know whether or not you are using an intrinsically safe teach pendant if you are working in a hazardous environment.

- Before teaching, visually inspect the robot and work envelope to make sure that no potentially hazardous conditions exist. The work envelope is the area defined by the maximum motion range of the robot. These include tooling attached to the wrist flange that extends this range.
- The area near the robot must be clean and free of oil, water, or debris. Immediately report unsafe working conditions to the supervisor or safety department.
- FANUC Robotics recommends that no one enter the work envelope of a robot that is on, except for robot teaching operations. However, if you must enter the work envelope, be sure all safeguards are in place, check the teach pendant DEADMAN switch for proper operation, and place the robot in teach mode. Take the teach pendant with you, turn it on, and be prepared to release the DEADMAN switch. Only the person with the teach pendant should be in the work envelope.

⚠️WARNING

Never bypass, strap, or otherwise deactivate a safety device, such as a limit switch, for any operational convenience. Deactivating a safety device is known to have resulted in serious injury and death.

- Know the path that can be used to escape from a moving robot; make sure the escape path is never blocked.
- Isolate the robot from all remote control signals that can cause motion while data is being taught.
- Test any program being run for the first time in the following manner:

⚠️WARNING

Stay outside the robot work envelope whenever a program is being run. Failure to do so can result in injury.

- Using a low motion speed, single step the program for at least one full cycle.
 - Using a low motion speed, test run the program continuously for at least one full cycle.
 - Using the programmed speed, test run the program continuously for at least one full cycle.
- Make sure all personnel are outside the work envelope before running production.

Staying Safe During Automatic Operation

Advise all personnel who operate the robot during production to observe the following rules:

- Make sure all safety provisions are present and active.

Safety

- Know the entire workcell area. The workcell includes the robot and its work envelope, plus the area occupied by all external devices and other equipment with which the robot interacts.
- Understand the complete task the robot is programmed to perform before initiating automatic operation.
- Make sure all personnel are outside the work envelope before operating the robot.
- Never enter or allow others to enter the work envelope during automatic operation of the robot.
- Know the location and status of all switches, sensors, and control signals that could cause the robot to move.
- Know where the EMERGENCY STOP buttons are located on both the robot control and external control devices. Be prepared to press these buttons in an emergency.
- Never assume that a program is complete if the robot is not moving. The robot could be waiting for an input signal that will permit it to continue its activity.
- If the robot is running in a pattern, do not assume it will continue to run in the same pattern.
- Never try to stop the robot, or break its motion, with your body. The only way to stop robot motion immediately is to press an EMERGENCY STOP button located on the controller panel, teach pendant, or emergency stop stations around the workcell.

Staying Safe During Inspection

When inspecting the robot, be sure to

- Turn off power at the controller.
- Lock out and tag out the power source at the controller according to the policies of your plant.
- Turn off the compressed air source and relieve the air pressure.
- If robot motion is not needed for inspecting the electrical circuits, press the EMERGENCY STOP button on the operator panel.
- Never wear watches, rings, neckties, scarves, or loose clothing that could get caught in moving machinery.
- If power is needed to check the robot motion or electrical circuits, be prepared to press the EMERGENCY STOP button, in an emergency.
- Be aware that when you remove a servomotor or brake, the associated robot arm will fall if it is not supported or resting on a hard stop. Support the arm on a solid support before you release the brake.

Staying Safe During Maintenance

When performing maintenance on your robot system, observe the following rules:

- Never enter the work envelope while the robot or a program is in operation.
- Before entering the work envelope, visually inspect the workcell to make sure no potentially hazardous conditions exist.

- Never wear watches, rings, neckties, scarves, or loose clothing that could get caught in moving machinery.
- Consider all or any overlapping work envelopes of adjoining robots when standing in a work envelope.
- Test the teach pendant for proper operation before entering the work envelope.
- If it is necessary for you to enter the robot work envelope while power is turned on, you must be sure that you are in control of the robot. Be sure to take the teach pendant with you, press the DEADMAN switch, and turn the teach pendant on. Be prepared to release the DEADMAN switch to turn off servo power to the robot immediately.
- Whenever possible, perform maintenance with the power turned off. Before you open the controller front panel or enter the work envelope, turn off and lock out the 3-phase power source at the controller.
- Be aware that when you remove a servomotor or brake, the associated robot arm will fall if it is not supported or resting on a hard stop. Support the arm on a solid support before you release the brake.

AWARNING

Lethal voltage is present in the controller WHENEVER IT IS CONNECTED to a power source. Be extremely careful to avoid electrical shock. HIGH VOLTAGE IS PRESENT at the input side whenever the controller is connected to a power source. Turning the disconnect or circuit breaker to the OFF position removes power from the output side of the device only.

- Release or block all stored energy. Before working on the pneumatic system, shut off the system air supply and purge the air lines.
- Isolate the robot from all remote control signals. If maintenance must be done when the power is on, make sure the person inside the work envelope has sole control of the robot. The teach pendant must be held by this person.
- Make sure personnel cannot get trapped between the moving robot and other equipment. Know the path that can be used to escape from a moving robot. Make sure the escape route is never blocked.
- Use blocks, mechanical stops, and pins to prevent hazardous movement by the robot. Make sure that such devices do not create pinch points that could trap personnel.

AWARNING

Do not try to remove any mechanical component from the robot before thoroughly reading and understanding the procedures in the appropriate manual. Doing so can result in serious personal injury and component destruction.

- Be aware that when you remove a servomotor or brake, the associated robot arm will fall if it is not supported or resting on a hard stop. Support the arm on a solid support before you release the brake.
- When replacing or installing components, make sure dirt and debris do not enter the system.
- Use only specified parts for replacement. To avoid fires and damage to parts in the controller, never use nonspecified fuses.
- Before restarting a robot, make sure no one is inside the work envelope; be sure that the robot and all external devices are operating normally.

KEEPING MACHINE TOOLS AND EXTERNAL DEVICES SAFE

Certain programming and mechanical measures are useful in keeping the machine tools and other external devices safe. Some of these measures are outlined below. Make sure you know all associated measures for safe use of such devices.

Programming Safety Precautions

Implement the following programming safety measures to prevent damage to machine tools and other external devices.

- Back-check limit switches in the workcell to make sure they do not fail.
- Implement “failure routines” in programs that will provide appropriate robot actions if an external device or another robot in the workcell fails.
- Use *handshaking* protocol to synchronize robot and external device operations.
- Program the robot to check the condition of all external devices during an operating cycle.

Mechanical Safety Precautions

Implement the following mechanical safety measures to prevent damage to machine tools and other external devices.

- Make sure the workcell is clean and free of oil, water, and debris.
- Use DCS (Dual Check Safety), software limits, limit switches, and mechanical hardstops to prevent undesired movement of the robot into the work area of machine tools and external devices.

KEEPING THE ROBOT SAFE

Observe the following operating and programming guidelines to prevent damage to the robot.

Operating Safety Precautions

The following measures are designed to prevent damage to the robot during operation.

- Use a low override speed to increase your control over the robot when jogging the robot.
- Visualize the movement the robot will make before you press the jog keys on the teach pendant.
- Make sure the work envelope is clean and free of oil, water, or debris.
- Use circuit breakers to guard against electrical overload.

Programming Safety Precautions

The following safety measures are designed to prevent damage to the robot during programming:

- Establish *interference zones* to prevent collisions when two or more robots share a work area.
- Make sure that the program ends with the robot near or at the home position.
- Be aware of signals or other operations that could trigger operation of tooling resulting in personal injury or equipment damage.
- In dispensing applications, be aware of all safety guidelines with respect to the dispensing materials.

NOTE: Any deviation from the methods and safety practices described in this manual must conform to the approved standards of your company. If you have questions, see your supervisor.

ADDITIONAL SAFETY CONSIDERATIONS FOR PAINT ROBOT INSTALLATIONS

Process technicians are sometimes required to enter the paint booth, for example, during daily or routine calibration or while teaching new paths to a robot. Maintenance personnel also must work inside the paint booth periodically.

Whenever personnel are working inside the paint booth, ventilation equipment must be used. Instruction on the proper use of ventilating equipment usually is provided by the paint shop supervisor.

Although paint booth hazards have been minimized, potential dangers still exist. Therefore, today's highly automated paint booth requires that process and maintenance personnel have full awareness of the system and its capabilities. They must understand the interaction that occurs between the vehicle moving along the conveyor and the robot(s), hood/deck and door opening devices, and high-voltage electrostatic tools.

CAUTION

Ensure that all ground cables remain connected. Never operate the paint robot with ground provisions disconnected. Otherwise, you could injure personnel or damage equipment.

Paint robots are operated in three modes:

- Teach or manual mode
- Automatic mode, including automatic and exercise operation
- Diagnostic mode

During both teach and automatic modes, the robots in the paint booth will follow a predetermined pattern of movements. In teach mode, the process technician teaches (programs) paint paths using the teach pendant.

In automatic mode, robot operation is initiated at the System Operator Console (SOC) or Manual Control Panel (MCP), if available, and can be monitored from outside the paint booth. All personnel must remain outside of the booth or in a designated safe area within the booth whenever automatic mode is initiated at the SOC or MCP.

In automatic mode, the robots will execute the path movements they were taught during teach mode, but generally at production speeds.

When process and maintenance personnel run diagnostic routines that require them to remain in the paint booth, they must stay in a designated safe area.

Paint System Safety Features

Process technicians and maintenance personnel must become totally familiar with the equipment and its capabilities. To minimize the risk of injury when working near robots and related equipment, personnel must comply strictly with the procedures in the manuals.

This section provides information about the safety features that are included in the paint system and also explains the way the robot interacts with other equipment in the system.

The paint system includes the following safety features:

- Most paint booths have red warning beacons that illuminate when the robots are armed and ready to paint. Your booth might have other kinds of indicators. Learn what these are.

- Some paint booths have a blue beacon that, when illuminated, indicates that the electrostatic devices are enabled. Your booth might have other kinds of indicators. Learn what these are.
- EMERGENCY STOP buttons are located on the robot controller and teach pendant. Become familiar with the locations of all E-STOP buttons.
- An intrinsically safe teach pendant is used when teaching in hazardous paint atmospheres.
- A DEADMAN switch is located on each teach pendant. When this switch is held in, and the teach pendant is on, power is applied to the robot servo system. If the engaged DEADMAN switch is released or pressed harder during robot operation, power is removed from the servo system, all axis brakes are applied, and the robot comes to an EMERGENCY STOP. Safety interlocks within the system might also E-STOP other robots.

WARNING

An EMERGENCY STOP will occur if the DEADMAN switch is released on a bypassed robot.

- Overtravel by robot axes is prevented by software limits. All of the major and minor axes are governed by software limits. DCS (Dual Check Safety), limit switches and hardstops also limit travel by the major axes.
- EMERGENCY STOP limit switches and photoelectric eyes might be part of your system. Limit switches, located on the entrance/exit doors of each booth, will EMERGENCY STOP all equipment in the booth if a door is opened while the system is operating in automatic or manual mode. For some systems, signals to these switches are inactive when the switch on the SOC is in teach mode.
- When present, photoelectric eyes are sometimes used to monitor unauthorized intrusion through the entrance/exit silhouette openings.
- System status is monitored by computer. Severe conditions result in automatic system shutdown.

Staying Safe While Operating the Paint Robot

When you work in or near the paint booth, observe the following rules, in addition to all rules for safe operation that apply to all robot systems.

WARNING

Observe all safety rules and guidelines to avoid injury.

⚠️ WARNING

Never bypass, strap, or otherwise deactivate a safety device, such as a limit switch, for any operational convenience. Deactivating a safety device is known to have resulted in serious injury and death.

⚠️ WARNING

Enclosures shall not be opened unless the area is known to be nonhazardous or all power has been removed from devices within the enclosure. Power shall not be restored after the enclosure has been opened until all combustible dusts have been removed from the interior of the enclosure and the enclosure purged. Refer to the Purge chapter for the required purge time.

- Know the work area of the entire paint station (workcell).
- Know the work envelope of the robot and hood/deck and door opening devices.
- Be aware of overlapping work envelopes of adjacent robots.
- Know where all red, mushroom-shaped EMERGENCY STOP buttons are located.
- Know the location and status of all switches, sensors, and/or control signals that might cause the robot, conveyor, and opening devices to move.
- Make sure that the work area near the robot is clean and free of water, oil, and debris. Report unsafe conditions to your supervisor.
- Become familiar with the complete task the robot will perform BEFORE starting automatic mode.
- Make sure all personnel are outside the paint booth before you turn on power to the robot servo system.
- Never enter the work envelope or paint booth before you turn off power to the robot servo system.
- Never enter the work envelope during automatic operation unless a safe area has been designated.
- Never wear watches, rings, neckties, scarves, or loose clothing that could get caught in moving machinery.
- Remove all metallic objects, such as rings, watches, and belts, before entering a booth when the electrostatic devices are enabled.
- Stay out of areas where you might get trapped between a moving robot, conveyor, or opening device and another object.
- Be aware of signals and/or operations that could result in the triggering of guns or bells.
- Be aware of all safety precautions when dispensing of paint is required.
- Follow the procedures described in this manual.

Special Precautions for Combustible Dusts (Powder Paint)

When the robot is used in a location where combustible dusts are found, such as the application of powder paint, the following special precautions are required to insure that there are no combustible dusts inside the robot.

- Purge maintenance air should be maintained at all times, even when the robot power is off. This will insure that dust can not enter the robot.
 - A purge cycle will not remove accumulated dusts. Therefore, if the robot is exposed to dust when maintenance air is not present, it will be necessary to remove the covers and clean out any accumulated dust. Do not energize the robot until you have performed the following steps.
1. Before covers are removed, the exterior of the robot should be cleaned to remove accumulated dust.
 2. When cleaning and removing accumulated dust, either on the outside or inside of the robot, be sure to use methods appropriate for the type of dust that exists. Usually lint free rags dampened with water are acceptable. Do not use a vacuum cleaner to remove dust as it can generate static electricity and cause an explosion unless special precautions are taken.
 3. Thoroughly clean the interior of the robot with a lint free rag to remove any accumulated dust.
 4. When the dust has been removed, the covers must be replaced immediately.
 5. Immediately after the covers are replaced, run a complete purge cycle. The robot can now be energized.

Staying Safe While Operating Paint Application Equipment

When you work with paint application equipment, observe the following rules, in addition to all rules for safe operation that apply to all robot systems.

WARNING

When working with electrostatic paint equipment, follow all national and local codes as well as all safety guidelines within your organization. Also reference the following standards: NFPA 33 Standards for Spray Application Using Flammable or Combustible Materials, and NFPA 70 National Electrical Code.

- **Grounding:** All electrically conductive objects in the spray area must be grounded. This includes the spray booth, robots, conveyors, workstations, part carriers, hooks, paint pressure pots, as well as solvent containers. Grounding is defined as the object or objects shall be electrically connected to ground with a resistance of not more than 1 megohms.
- **High Voltage:** High voltage should only be on during actual spray operations. Voltage should be off when the painting process is completed. Never leave high voltage on during a cap cleaning process.
- Avoid any accumulation of combustible vapors or coating matter.
- Follow all manufacturer recommended cleaning procedures.
- Make sure all interlocks are operational.

- No smoking.
- Post all warning signs regarding the electrostatic equipment and operation of electrostatic equipment according to NFPA 33 Standard for Spray Application Using Flammable or Combustible Material.
- Disable all air and paint pressure to bell.
- Verify that the lines are not under pressure.

Staying Safe During Maintenance

When you perform maintenance on the painter system, observe the following rules, and all other maintenance safety rules that apply to all robot installations. Only qualified, trained service or maintenance personnel should perform repair work on a robot.

- Paint robots operate in a potentially explosive environment. Use caution when working with electric tools.
- When a maintenance technician is repairing or adjusting a robot, the work area is under the control of that technician. All personnel not participating in the maintenance must stay out of the area.
- For some maintenance procedures, station a second person at the control panel within reach of the EMERGENCY STOP button. This person must understand the robot and associated potential hazards.
- Be sure all covers and inspection plates are in good repair and in place.
- Always return the robot to the “home” position before you disarm it.
- Never use machine power to aid in removing any component from the robot.
- During robot operations, be aware of the robot’s movements. Excess vibration, unusual sounds, and so forth, can alert you to potential problems.
- Whenever possible, turn off the main electrical disconnect before you clean the robot.
- When using vinyl resin observe the following:
 - Wear eye protection and protective gloves during application and removal.
 - Adequate ventilation is required. Overexposure could cause drowsiness or skin and eye irritation.
 - If there is contact with the skin, wash with water.
 - Follow the Original Equipment Manufacturer’s Material Safety Data Sheets.
- When using paint remover observe the following:
 - Eye protection, protective rubber gloves, boots, and apron are required during booth cleaning.
 - Adequate ventilation is required. Overexposure could cause drowsiness.
 - If there is contact with the skin or eyes, rinse with water for at least 15 minutes. Then seek medical attention as soon as possible.
 - Follow the Original Equipment Manufacturer’s Material Safety Data Sheets.

SAFETY PRECAUTIONS

The "Safety Precautions" section describes the safety precautions relating to the use of FANUC servo motors, spindle motors, and servo amplifiers (Power Supply, Servo Amplifier, and Spindle Amplifier). Users of any servo motor or amplifier model are requested to read the "Safety Precautions" carefully before using the servo motor or amplifier.

The users are also requested to read an applicable specification manual carefully and understand each function of the motor or amplifier for correct use.

The users are basically forbidden to do any behavior or action not mentioned in the "Safety Precautions." They are invited to ask FANUC previously about what behavior or action is prohibited.

1.1 DEFINITION OF WARNING, CAUTION, AND NOTE

This manual includes safety precautions for protecting the user and preventing damage to the machine. Precautions are classified into Warning and Caution according to their bearing on safety. Also, supplementary information is described as a Note. Read the Warning, Caution, and Note thoroughly before attempting to use the machine.

WARNING

Applied when there is a danger of the user being injured or when there is a damage of both the user being injured and the equipment being damaged if the approved procedure is not observed.

CAUTION

Applied when there is a danger of the equipment being damaged, if the approved procedure is not observed.

NOTE

The Note is used to indicate supplementary information other than Warning and Caution.

If a precaution described even as "CAUTION" is not followed, a serious result may be caused depending on the status. Be sure to follow the precautions described as "WARNING" and "CAUTION" since they give important information.

* Read this manual carefully, and store it in a safe place.

1.2 FANUC AC SERVO MOTOR α *is*/ α *i* series FANUC AC SPINDLE MOTOR α *i* series

1.2.1 Warning

 **WARNING**

- **Be sure to ground a motor frame.**

To avoid electric shocks, be sure to connect the grounding terminal in the terminal box to the grounding terminal of the machine.

- **Before starting to connect a motor to electric wires, make sure they are isolated from an electric power source.**

A failure to observe this caution is very dangerous because you may get electric shocks.

- **Do not ground a motor power wire terminal or short-circuit it to another power wire terminal.**

A failure to observe this caution may cause electric shocks or a burned wiring.

- * Some motors require a special connection such as a winding changeover. For details, refer to Chapter 7, "OUTLINE DRAWINGS," in B-65262EN.

- **When connecting a cord such as a power line to the terminal block, use specified tightening torque to firmly connect the cord.**

If operation is performed with a loose terminal, the terminal block can overheat, resulting in a fire. Moreover, a terminal can be detached, resulting in a ground fault, short circuit, or electric shock.

- **Do not apply current when a terminal of the terminal block or the crimp terminal of a power line is exposed.**

If the hand or a conductive object touches a terminal of the terminal block or the crimp terminal of a power line, you may get electric shocks. Attach an insulation cover (accessory) onto the terminal block. Moreover, cover the crimp terminal at the tip of a power line with an insulation tube.

- **Assemble and install a power connector securely.**

If a power line is detached due to a failure in crimping or soldering, or a conductive area is exposed due to a failure in shell assembly, you may get electric shocks.

- **Do not touch a motor with a wet hand.**

A failure to observe this caution is very dangerous because you may get electric shocks.

- **Before touching a motor, shut off the power to it.**

Even if a motor is not rotating, there may be a voltage across the terminals of the motor. Especially before touching a power supply connection, take sufficient precautions. Otherwise you may get electric shocks.

- **Do not touch any terminal of a motor for a while (at least 20 minutes) after the power to the motor is shut off.**

High voltage remains across power line terminals of a motor for a while after the power to the motor is shut off. So, do not touch any terminal or connect it to any other equipment. Otherwise, you may get electric shocks or the motor and/or equipment may get damaged.

- **On the machine, install a stop device for securing safety.**

The brake built into the servo motor is not a stop device for securing safety. The machine may not be held if a failure occurs.

⚠ WARNING**- Do not enter the area under the vertical axis without securing safety.**

If a vertical axis drop occurs unexpectedly, you may be injured.

- Fasten a motor firmly before driving the motor.

If a motor is driven when the motor is not fastened firmly or is fastened insufficiently, the motor can tumble or is removed, resulting in a danger. If the motor mounting section is not sufficiently strong, the machine may be damaged or the user may be injured.

- Do not get close to a rotary section of a motor when it is rotating.

When a motor is rotating, clothes or fingers can be caught, resulting in an injury.

- Do not drive a motor with an object such as a key exposed.

An object such as a key can be thrown away, resulting in an injury. Before rotating a motor, check that there is no object that is thrown away by motor rotation.

- Do not apply a radial load exceeding the "allowable radial load".

The shaft can break, and components can be thrown away. When the vertical axis is involved, a vertical axis drop can occur.

- To drive a motor, use a specified amplifier and parameters.

An incorrect combination of a motor, amplifier, and parameters may cause the motor to behave unexpectedly. This is dangerous, and the motor may get damaged.

- Do not bring any dangerous stuff near a motor.

Motors are connected to a power line, and may get hot. If a flammable is placed near a motor, it may be ignited, catch fire, or explode.

- Be safely dressed when handling a motor.

Wear safety shoes or gloves when handling a motor as you may get hurt on any edge or protrusion on it or electric shocks.

- Use a crane or lift to move a motor from one place to another.

A motor is heavy, so that if you lift a motor by hand, you may be exposed to various risks. For example, the waist can be damaged, and the motor can drop to injure you. Use equipment such as a crane as needed. (For the weight of a motor, see Specification manual (B-65262EN).)

- Do not touch a motor when it is running or immediately after it stops.

A motor may get hot when it is running. Do not touch the motor before it gets cool enough. Otherwise, you may get burned.

- Be careful not get your hair or cloths caught in a fan.

Be careful especially for a fan used to generate an inward air flow.

Be careful also for a fan even when the motor is stopped, because it continues to rotate while the amplifier is turned on.

- Install the components around a motor securely.

If a component is displaced or removed during motor rotation, a danger can result.

1.2.2 Caution

CAUTION

- **Use the eyebolt of a motor to move the motor only.**

When a motor is installed on a machine, do not move the machine by using the eyebolt of the motor. Otherwise, the eyebolt and motor can be damaged.

- **Do not disassemble a motor.**

Disassembling a motor may cause a failure or trouble in it.

If disassembly is in need because of maintenance or repair, please contact a service representative of FANUC.

For pulse coder replacement, refer to the Subsection III-1.2.6.

- **Do not machine and modify a motor.**

Do not machine and modify a motor in any case except when motor machining or modification is specified by FANUC. Modifying a motor may cause a failure or trouble in it.

- **Do not conduct dielectric strength or insulation test for a sensor.**

Such a test can damage elements in the sensor.

- **Be sure to connect motor cables correctly.**

An incorrect connection of a cable cause abnormal heat generation, equipment malfunction, or failure. Always use a cable with an appropriate current carrying capacity (or thickness). For details, refer to Chapter 7, "OUTLINE DRAWINGS" in the Specification manual (B-65262EN).

- **Do not apply shocks to a motor or cause scratches to it.**

If a motor is subjected to shocks or is scratched, its components may be adversely affected, resulting in normal operation being impaired. Plastic components and sensors can be damaged easily. So, handle those components very carefully. In particular, do not lift a motor by using a plastic component, connector, terminal block, and so forth.

- **Do not step or sit on a motor, and do not put a heavy object on a motor.**

If you step or sit on a motor, it may get deformed or broken. Do not put a motor on another unless they are in packages.

- **When attaching a component having inertia, such as a pulley, to a motor, ensure that any imbalance between the motor and component is minimized.**

If there is a large imbalance, the motor may vibrates abnormally, resulting in the motor being broken.

- **Be sure to attach a key to a motor with a keyed shaft.**

If a motor with a keyed shaft runs with no key attached, it may impair torque transmission or cause imbalance, resulting in the motor being broken.

- **Use a motor under an appropriate environmental condition.**

Using a motor in an adverse environment may cause a failure or trouble in it. Refer to Specification manual (B-65262EN) for details of the operating and environmental conditions for motors.

- **Do not apply a commercial power source voltage directly to a motor.**

Applying a commercial power source voltage directly to a motor may result in its windings being burned. Be sure to use a specified amplifier for supplying voltage to the motor.

⚠ CAUTION**- Do not use the brake built into a motor for braking.**

The brake built into a servo motor is designed for holding. If the brake is used for braking, a failure can occur.

- Ensure that motors are cooled if they are those that require forcible cooling.

If a motor that requires forcible cooling is not cooled normally, it may cause a failure or trouble. For a fan-cooled motor, ensure that it is not clogged or blocked with dust and dirt. For a liquid-cooled motor, ensure that the amount of the liquid is appropriate and that the liquid piping is not clogged. For both types, perform regular cleaning and inspection.

- When storing a motor, put it in a dry (non-condensing) place at room temperature (0 to 40 °C).

If a motor is stored in a humid or hot place, its components may get damaged or deteriorated. In addition, keep a motor in such a position that its shaft is held horizontal and its terminal box is at the top.

- FANUC motors are designed for use with machines. Do not use them for any other purpose.

If a FANUC motor is used for an unintended purpose, it may cause an unexpected symptom or trouble. If you want to use a motor for an unintended purpose, previously consult with FANUC.

1.2.3 Note

NOTE**- Ensure that a base or frame on which a motor is mounted is strong enough.**

Motors are heavy. If a base or frame on which a motor is mounted is not strong enough, it is impossible to achieve the required precision.

- Do not remove a nameplate from a motor.

If a nameplate comes off, be careful not to lose it. If the nameplate is lost, the motor becomes unidentifiable, resulting in maintenance becoming impossible.

- When testing the winding or insulation resistance of a motor, satisfy the conditions stipulated in IEC60034.

Testing a motor under a condition severer than those specified in IEC60034 may damage the motor.

- For a motor with a terminal box, make a conduit hole for the terminal box in a specified position.

When making a conduit hole, be careful not to break or damage unspecified portions. Refer to the Specification manual (B-65262EN).

- Before using a motor, measure its winding and insulation resistances, and make sure they are normal.

Especially for a motor that has been stored for a prolonged period of time, conduct these checks. A motor may deteriorate depending on the condition under which it is stored or the time during which it is stored. For the winding resistances of motors, refer to the Specification manual (B-65262EN), or ask FANUC. For insulation resistances, see the following table.

NOTE

- **To use a motor as long as possible, perform periodic maintenance and inspection for it, and check its winding and insulation resistances.**

Note that extremely severe inspections (such as dielectric strength tests) of a motor may damage its windings. For the winding resistances of motors, refer to the Specification manual (B-65262EN), or ask FANUC. For insulation resistances, see the following table.

MOTOR INSULATION RESISTANCE MEASUREMENT

Measure an insulation resistance between each winding and motor frame using an insulation resistance meter (500 VDC). Judge the measurements according to the following table. Make an insulation resistance measurement on a single motor unit after detaching cords such as a power line.

Insulation resistance	Judgment
100 MΩ or higher	Acceptable
10 to 100 MΩ	The winding has begun deteriorating. There is no problem with the performance at present. Be sure to perform periodic inspection.
1 to 10 MΩ	The winding has considerably deteriorated. Special care is in need. Be sure to perform periodic inspection.
Lower than 1 MΩ	Unacceptable. Replace the motor.

1.3 FANUC SERVO AMPLIFIER *αi* series

1.3.1 Warnings and Cautions Relating to Mounting

1.3.1.1 Warning

WARNING

- **Check the specification code of the amplifier.**
Check that the delivered amplifier is as originally ordered.
- **Mount a ground fault interrupter.**
To guard against fire and electric shock, fit the factory power supply or machine with a ground fault interrupter (designed for use with an inverter).
- **Securely ground the amplifier.**
Securely connect the ground terminal and metal frame of the amplifier and motor to a common ground plate of the power magnetics cabinet.
- **Be aware of the weight of the amplifier and other components.**
Control motor amplifiers and AC reactors are heavy. When transporting them or mounting them in the cabinet, therefore, be careful not to injure yourself or damage the equipment. Be particularly carefull not to jam your fingers between the cabinet and amplifier.
- **Never ground or short-circuit either the power supply lines or power lines.**
Protect the lines from any stress such as bending. Handle the ends appropriately.
- **Ensure that the power supply lines, power lines, and signal lines are securely connected.**
A loose screw, loose connection, or the like will cause a motor malfunction or overheating, or a ground fault.
Be extremely careful with power supply lines, motor power lines, and DC link connections through which a large amount of current passes, because a loose screw (or poor contact in a connector or poor connection between a connector terminal and a cable) may cause a fire.
- **Insulate all exposed parts that are charged.**
- **Never touch the regenerative discharge resistor or radiator directly.**
The surface of the radiator and regenerative discharge unit become extremely hot. Never touch them directly. An appropriate structure should also be considered.
- **Close the amplifier cover after completing the wiring.**
Leaving the cover open presents a danger of electric shock.
- **Do not disassemble the amplifier.**
- **Ensure that the cables used for the power supply lines and power lines are of the appropriate diameter and temperature ratings.**
- **Do not apply an excessively large force to plastic parts.**
If a plastic section breaks, it may cause internal damage, thus interfering with normal operation. The edge of a broken section is likely to be sharp and, therefore, presents a risk of injury.

1.3.1.2 Caution

CAUTION

- **Do not step or sit on the amplifier.**
Also, do not stack unpacked amplifiers on top of each other.
- **Use the amplifier in an appropriate environment.**
See the allowable ambient temperatures and other requirements, given in the corresponding descriptions.
- **Protect the amplifier from corrosive or conductive mist or drops of water.**
Use a filter if necessary.
- **Protect the amplifier from impact.**
Do not place anything on the amplifier.
- **Do not block the air inlet to the radiator.**
A deposit of coolant, oil mist, or chips on the air inlet will result in a reduction in the cooling efficiency. In some cases, the required efficiency cannot be achieved. The deposit may also lead to a reduction in the useful life of the semiconductors. Especially, when outside air is drawn in, mount filters on both the air inlet and outlet. These filters must be replaced regularly.
So, an easy-to-replace type of filter should be used.
- **Connect the power supply lines and power lines to the appropriate terminals and connectors.**
- **Connect the signal lines to the appropriate connectors.**
- **Before connecting the power supply wiring, check the supply voltage.**
Check that the supply voltage is within the range specified in this manual, then connect the power supply lines.
- **Ensure that the combination of motor and amplifier is appropriate.**
- **Ensure that valid parameters are specified.**
Specifying an invalid parameter for the combination of motor and amplifier may not only prevent normal operation of the motor but also result in damage to the amplifier.
- **Ensure that the amplifier and peripheral equipment are securely connected.**
Check that the magnetic contactor, circuit breaker, and other devices mounted outside the amplifier are securely connected to each other and that those devices are securely connected to the amplifier.
- **Check that the amplifier is securely mounted in the power magnetics cabinet.**
If any clearance is left between the power magnetics cabinet and the surface on which the amplifier is mounted, dust entering the gap may build up and prevent the normal operation of the amplifier.
- **Apply appropriate countermeasures against noise.**
Adequate countermeasures against noise are required to maintain normal operation of the amplifier. For example, signal lines must be routed away from power supply lines and power lines.

1.3.1.3 Note

NOTE

- **Keep the nameplate clearly visible.**
- **Keep the legend on the nameplate clearly visible.**
- **After unpacking the amplifier, carefully check for any damage.**
- **Mount the amplifier in a location where it can be easily accessed periodic inspection and daily maintenance.**
- **Leave sufficient space around the machine to enable maintenance to be performed easily.**
Do not place any heavy objects such that they would interfere with the opening of the doors.
- **Keep the parameter table and spare parts at hand.**
Also, keep the specifications at hand. These items must be stored in a location where they can be retrieved immediately.
- **Provide adequate shielding.**
A cable to be shielded must be securely connected to the ground plate, using a cable clamp or the like.

1.3.2 Warnings and Cautions Relating to a Pilot Run

1.3.2.1 Warning

⚠ WARNING

- **Before turning on the power, check that the cables connected to the power magnetics cabinet and amplifier, as well as the power lines and power supply lines, are securely connected. Also, check that no lines are slack.**
A loose screw, loose connection, or the like will cause a motor malfunction or overheating, or a ground fault. Be extremely careful with power supply lines, motor power lines, and DC link connections through which a large amount of current passes, because a loose screw (or poor contact in a connector or poor connection between a connector terminal and a cable) may cause a fire.
- **Before turning on the power, ensure that the power magnetics cabinet is securely grounded.**
- **Before turning on the power, check that the door of the power magnetics cabinet and all other doors are closed.**
Ensure that the door of the power magnetics cabinet containing the amplifier, and all other doors, are securely closed. During operation, all doors must be closed and locked.
- **Apply extreme caution if the door of the power magnetics cabinet or another door must be opened.**
Only a person trained in the maintenance of the corresponding machine or equipment should open the door, and only after shutting off the power supply to the power magnetics cabinet (by opening both the input circuit breaker of the power magnetics cabinet and the factory switch used to supply power to the cabinet). If the machine must be operated with the door open to enable adjustment or for some other purpose, the operator must keep his or her hands and tools well away from any dangerous voltages. Such work must be done only by a person trained in the maintenance of the machine or equipment.

⚠ WARNING

- **When operating the machine for the first time, check that the machine operates as instructed.**
To check whether the machine operates as instructed, first specify a small value for the motor, then increase the value gradually. If the motor operates abnormally, perform an emergency stop immediately.
- **After turning on the power, check the operation of the emergency stop circuit.**
Press the emergency stop button to check that the motor stops immediately, and that the power being supplied to the amplifier is shut off by the magnetic contactor.
- **Before opening a door or protective cover of a machine to enable adjustment of the machine, first place the machine in the emergency stop state and check that the motor has stopped.**

1.3.2.2 Caution

⚠ CAUTION

- **Note whether an alarm status relative to the amplifier is displayed at power-up or during operation.**
If an alarm is displayed, take appropriate action as explained in the maintenance manual. If the work to be done requires that the door of the power magnetics cabinet be left open, the work must be carried out by a person trained in the maintenance of the machine or equipment. Note that if some alarms are forcibly reset to enable operation to continue, the amplifier may be damaged. Take appropriate action according to the contents of the alarm.
- **Before operating the motor for the first time, mount and adjust the position and speed sensors.**
Following the instructions given in the maintenance manual, adjust the position and speed sensors for the spindle so that an appropriate waveform is obtained.
If the sensors are not properly adjusted, the motor may not rotate normally or the spindle may fail to stop as desired.
- **If the motor makes any abnormal noise or vibration while operating, stop it immediately.**
Note that if operation is continued in spite of there being some abnormal noise or vibration, the amplifier may be damaged. Take appropriate corrective action, then resume operation.
- **Observe the ambient temperature and output rating requirements.**
The continuous output rating or continuous operation period of some amplifiers may fall as the ambient temperature increases. If the amplifier is used continuously with an excessive load applied, the amplifier may be damaged.
- **Unless otherwise specified, do not insert or remove any connector while the power is turned on. Otherwise, the amplifier may fail.**

1.3.3 Warnings and Cautions Relating to Maintenance

1.3.3.1 Warning

WARNING

- **Read the maintenance manual carefully and ensure that you are totally familiar with its contents.**

The maintenance manual describes daily maintenance and the procedures to be followed in the event of an alarm being issued. The operator must be familiar with these descriptions.

- Notes on replacing a fuse or PC board

- 1) Before starting the replacement work, ensure that the circuit breaker protecting the power magnetics cabinet is open.
- 2) Check that the red LED that indicates that charging is in progress is not lit.
The position of the charging LED on each model of amplifier is given in this manual. While the LED is lit, hazardous voltages are present inside the unit, and thus there is a danger of electric shock.
- 3) Some PC board components become extremely hot. Be careful not to touch these components.
- 4) Ensure that a fuse having an appropriate rating is used.
- 5) Check the specification code of a PC board to be replaced. If a modification drawing number is indicated, contact FANUC before replacing the PC board.
Also, before and after replacing a PC board, check its pin settings.
- 6) After replacing the fuse, ensure that the screws are firmly tightened. For a socket-type fuse, ensure that the fuse is inserted correctly.
- 7) After replacing the PC board, ensure that it is securely connected.
- 8) Ensure that all power lines, power supply lines, and connectors are securely connected.

- **Take care not to lose any screws.**

When removing the case or PC board, take care not to lose any screws. If a screw is lost inside the unit and the power is turned on, the machine may be damaged.

- **Notes on replacing the battery of the absolute pulse coder**

Replace the battery only while the power is on. If the battery is replaced while the power is turned off, the stored absolute positioning data will be lost. Some series servo amplifier modules have batteries in their servo amplifiers. To replace the battery of any of those models, observe the following procedure: Open the door of the power magnetics cabinet; Leave the control power of the power supply module on; Place the machine in the emergency stop state so that the power being input to the amplifier is shut off; Then, replace the battery. Replacement work should be done only by a person who is trained in the related maintenance and safety requirements. The power magnetics cabinet in which the servo amplifier is mounted has a high-voltage section. This section presents a severe risk of electric shock.

- **Check the number of any alarm.**

If the machine stops upon an alarm being issued, check the alarm number. Some alarms indicate that a component must be replaced. If the power is reconnected without first replacing the failed component, another component may be damaged, making it difficult to locate the original cause of the alarm.

- **Before resetting an alarm, ensure that the original cause of the alarm has been removed.**

- **Contact FANUC whenever a question relating to maintenance arises.**

- **Notes on removing the amplifier**

Before removing the amplifier, first ensure that the power is shut off. Be careful not to jam your fingers between the power magnetics cabinet and amplifier.

1.3.3.2 Caution

CAUTION

- **Ensure that all required components are mounted.**

When replacing a component or PC board, check that all components, including the snubber capacitor, are correctly mounted. If the snubber capacitor is not mounted, for example, the IPM will be damaged.

- **Tighten all screws firmly.**

- **Check the specification code of the fuse, PC board, and other components.**

When replacing a fuse or PC board, first check the specification code of the fuse or PC board, then mount it in the correct position. The machine will not operate normally if a fuse or PC board having other than the correct specification code is mounted, or if a fuse or PC board is mounted in the wrong position.

- **Mount the correct cover.**

The cover on the front of the amplifier carries a label indicating a specification code. When mounting a previously removed front cover, take care to mount it on the unit from which it was removed.

- **Notes on cleaning the heat sink and fan**

- 1) A dirty heat sink or fan results in reduced semiconductor cooling efficiency, which degrades reliability. Periodic cleaning is necessary.
- 2) Using compressed air for cleaning scatters the dust. A deposit of conductive dust on the amplifier or peripheral equipment will result in a failure.
- 3) To clean the heat sink, do so only after turning the power off and ensuring that the heat sink has cooled to room temperature. The heat sink becomes extremely hot, such that touching it during operation or immediately after power-off is likely to cause a burn. Be extremely careful when touching the heat sink.

1.3.3.3 Note

NOTE

- **Ensure that the battery connector is correctly inserted.**

If the power is shut off while the battery connector is not connected correctly, the absolute position data for the machine will be lost.

- **Store the manuals in a safe place.**

The manuals should be stored in a location where they can be accessed immediately if so required during maintenance work.

- **Notes on contacting FANUC**

Inform FANUC of the details of an alarm and the specification code of the amplifier so that any components required for maintenance can be quickly secured, and any other necessary action can be taken without delay.

PREFACE

Organization of this manual

This manual describes information necessary to maintain FANUC Servo Amplifier αi series products, such as a Power Supply, Servo Amplifier, and Spindle Amplifier and FANUC Servo Motor $\alpha is/\alpha i$ series and FANUC Spindle Motor αi series products.

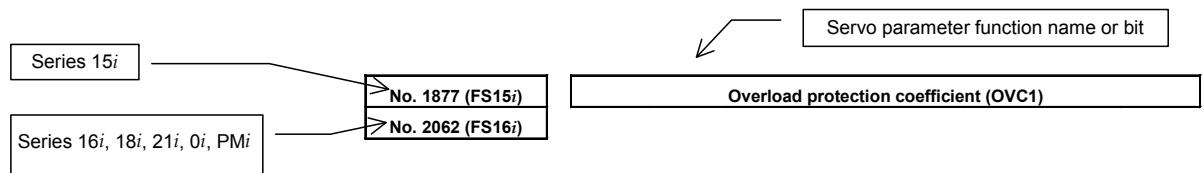

Part I explains the start-up procedure, and part II focuses on troubleshooting.

Part III explains the maintenance for servo motor and spindle motor.

The abbreviations listed below are used in this manual.

Product name	Abbreviations
FANUC Series 15 <i>i</i>	FS15 <i>i</i>
FANUC Series 16 <i>i</i>	FS16 <i>i</i>
FANUC Series 18 <i>i</i>	FS18 <i>i</i>
FANUC Series 21 <i>i</i>	FS21 <i>i</i>
FANUC Series 30 <i>i</i>	FS30 <i>i</i>
FANUC Series 31 <i>i</i>	FS31 <i>i</i>
FANUC Series 32 <i>i</i>	FS32 <i>i</i>
FANUC Series 0 <i>i</i>	FS0 <i>i</i>
FANUC Power Mate <i>i-D</i>	PM <i>i</i>
FANUC Power Mate <i>i-H</i>	
Power Supply	PS
Servo Amplifier	SV
Spindle Amplifier	SP

- * In this manual, the parameter numbers of servo parameters are sometimes indicated without CNC product names as follows:

- * The manuals shown below provide information related to this manual. This manual may refer you to these manuals.

----------	---	------------

ADDITIONAL INFORMATION

I. START-UP PROCEDURE

1 OVERVIEW

This part describes the units and components of the Servo Amplifier. It also explains the following information necessary to start up the Servo Amplifier:

- Configurations
- Start-up procedure
- Confirmation of the operation
- Periodic maintenance of servo amplifier

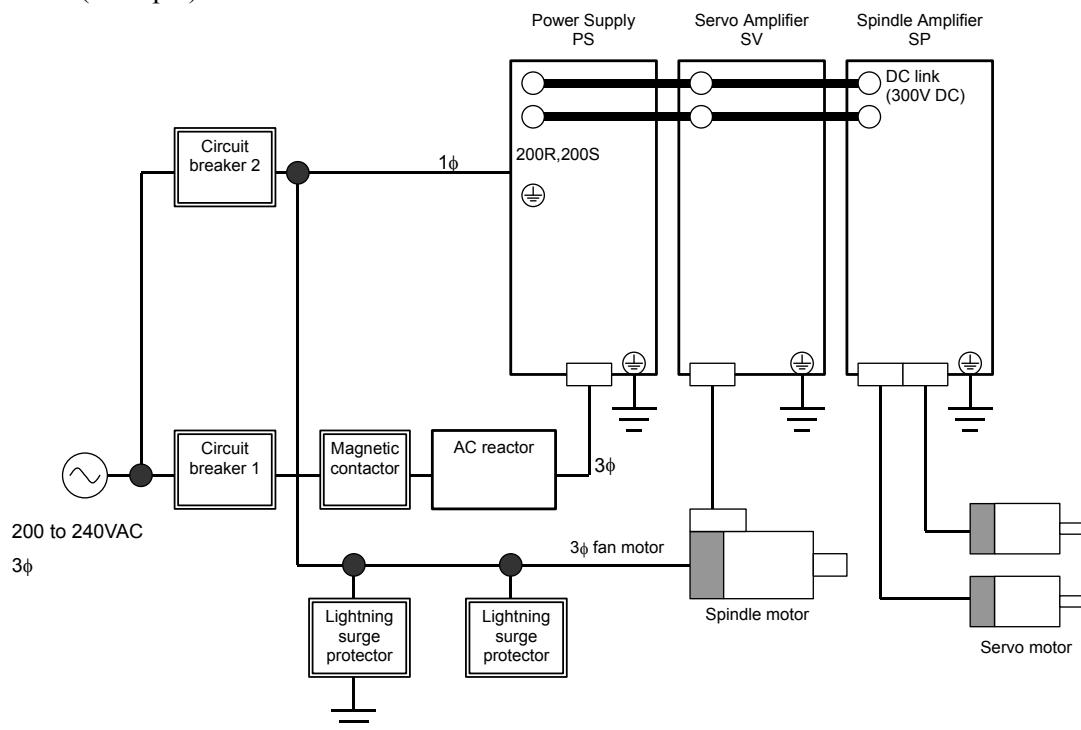

2 CONFIGURATIONS

2.1 CONFIGURATIONS

The FANUC servo amplifier *ai* series consists of the units and components listed below:

- | | |
|--|----------|
| (1) Power Supply (PS) | (basic) |
| (2) Servo Amplifier (SV) | (basic) |
| (3) Spindle Amplifier (SP) | (basic) |
| (4) AC reactor | (basic) |
| (5) Connectors (for connecting cables) | (basic) |
| (6) Fuses | (option) |
| (7) Power transformer | (option) |

Constituent (example)

Units prepared by the machine tool builder

NOTE

- 1 See Chapter 4, "HOW TO SELECT THE MODULE" in the FANUC SERVO AMPLIFIER *ai* series (B-65282EN) for details of how to combine the Power Supply, Servo Amplifiers, and Spindle Amplifiers.
- 2 A magnetic contactor, AC reactor, and circuit breakers are always required.
- 3 To protect the unit from surge currents caused by lightning, connect surge absorbers between lines, and between the lines and ground, at the power inlet of the power magnetics cabinet. See Appendix A, "FITTING A LIGHTNING SURGE PROTECTION DEVICE" in the FANUC SERVO AMPLIFIER *ai* series (B-65282EN) for details.

2.2 MAJOR COMPONENTS

2.2.1 Power Supply

(1) Power Supply (PS, 200VAC-input, power regeneration type)

Model	Order specification	Unit specification	Wiring board specification	Printed circuit board specification
ai PS 5.5	A06B-6110-H006	A06B-6110-C006	A16B-2203-0640	A20B-2100-0391(*1)
ai PS 11	A06B-6110-H011	A06B-6110-C011	A16B-2203-0641	A20B-2100-0391(*1)
ai PS 15	A06B-6110-H015	A06B-6110-C015	A16B-2203-0642	A20B-2100-0391(*1)
ai PS 26	A06B-6110-H026	A06B-6110-C026	A16B-2203-0630	A20B-2100-0391(*2)
ai PS 30	A06B-6110-H030	A06B-6110-C030	A16B-2203-0631	A20B-2100-0391(*2)

3 START-UP PROCEDURE

3.1 START-UP PROCEDURE (OVERVIEW)

Make sure that the specifications of the CNC, servo motors, servo amplifiers, and other units you received are exactly what you ordered, and these units are connected correctly. Then, turn on the power.

- (1) Before turning on the circuit breaker, check the power supply voltage connected.
→ See Section 3.2.
- (2) Some types of Power Supply, Servo Amplifier, and Spindle Amplifier require settings before the system can be used. So check whether you must make settings.
→ See Section 3.3.
- (3) Turn on the power, and set initial parameters on the CNC.

For the initialization of servo parameters, refer to the following manual:
FANUC AC SERVO MOTOR αi series Parameter Manual (B-65270EN)

For the initialization of spindle parameters, refer to the following manual:
FANUC AD SPINDLE MOTOR αi series Parameter Manual (B-65280EN)

- (4) For start-up adjustment and troubleshooting, see Chapter 4.
 - Method of using optional wiring boards for adjustment of the Power Supply, Servo Amplifier, and Spindle Amplifier
 - Spindle sensor adjustment values

3.2 CONNECTING THE POWER

3.2.1 Checking the Voltage and Capacity of the Power

Before connecting the power, you should measure the AC power voltage.

Table 3.2.1 (c) and (b) list the input power specification for the Power Supply. Use a power source with sufficient capacity so that the system will not malfunction due to a voltage drop even at a time of peak load.

Table 3.2.1 (c) AC power voltage specifications (200-V input type)

Model	αiPS 5.5	αiPS 11	αiPS 15	αiPS 26	$\alpha iiPS$ 30	αiPS 37	αiPS 55	
Nominal voltage rating	200 to 240 VAC -15%,+10%							
Power source frequency	50/60 Hz ± 1 Hz							
Power source capacity (for the main circuit) [kVA]	9	17	22	37	44	53	79	
Power source capacity (for the control circuit) [kVA]	0.7							

Table 3.2.1 (d) AC power voltage specifications (200-V input type)

Model	αiPS 11HV	αiPS 18HV	αiPS 30HV	αiPS 45HV	αiPS 60HV	αiPS 75HV		
Nominal voltage rating (for the main circuit)	400 to 480VAC -15%,+10%							
Nominal voltage rating (for the control circuit)	200 to 240VAC -15%,+10%							
Power source frequency	50/60Hz ±1Hz							
Power source capacity (for the main circuit) [kVA]	17	26	44	64	86	143		
Power source capacity (for the control circuit) [kVA]	0.7							

3.2.2 Connecting a Protective Ground

Refer to the items in Chapter 5, "Installation," in "FANUC SERVO AMPLIFIER αi series Descriptions (B-65282EN)", and check that the protective ground line is connected correctly.

3.2.3 Selecting the Ground Fault Interrupter That Matches the Leakage Current

Refer to the items in Chapter 5, "Installation," in " FANUC SERVO AMPLIFIER αi series Descriptions (B-65282EN)", and check that a correct ground fault interrupter is selected.

3.2.4 Checking the Phase Sequence of the Fan Motor Power Supply

When connecting a power supply to a three-phase fan motor, check that the phase sequence is correct. If the phase sequence is incorrect, the fan motor rotates in the reverse direction, which may decrease cooling efficiency or stop the fan motor due to overheating.

3.3 INITIALIZING PARAMETERS

(1) Servo Amplifier

For the initialization of servo parameters, refer to the following manual:
FANUC AC SERVO MOTOR αi series Parameter Manual (B-65270EN)

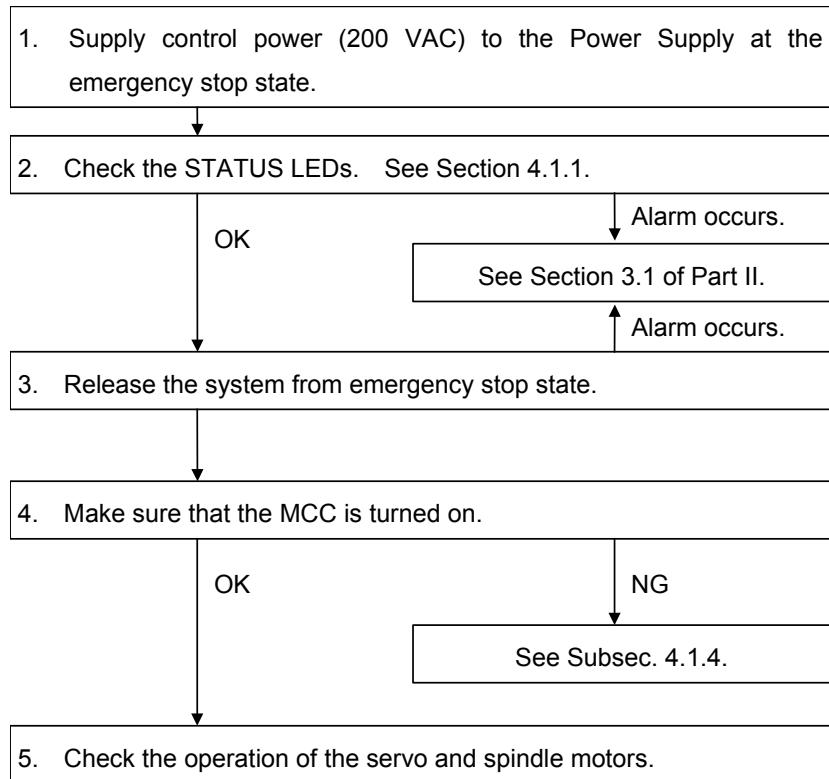

(2) Spindle Amplifier

For the initialization of spindle parameters, refer to the following manual:
FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN)

4 CONFIRMATION OF THE OPERATION

4.1 POWER SUPPLY

Check each item according to the procedure described below.

4.1.1 Checking the Status LEDs (Power Supply)

The STATUS display (a 7-segment LED) on the front of the Power Supply indicates the operation status.

STATUS LED position	STATUS display	Description
		The STATUS LED is off. Control power has not been supplied, cable is faulty, or control power circuit is defective.
		Not ready status The main circuit is not supplied with power (magnetic contactor is off); emergency stop state. When blinking: Power is off.
		Ready status The main circuit is supplied with power (magnetic contactor is on); the power supply is ready for operation. When blinking: Power is off.
		Warning state (The dot at the lower right lights.) The power supply has failed; an alarm has occurred after a certain time of operation. The warning type is indicated by the character displayed.
		Alarm status The alarm type is indicated by the character displayed.

4.1.2 Check Terminal on the Printed-circuit Board

To the Power Supply connector JX1B, the input current check signal is output. To observe the output, use the servo check pin board A06B-6071-K290 (see below).

Table 4.1.2(a) Check pins

Check pin	Description	Location of observation	Remark
IR	L1 phase (R-phase) current	JX1B-pin1	
IS	L2 phase (S-phase) current	JX1B-pin2	
0V	Reference point of observation	JX1B-pin12,14,16	The "+" sign with respect to the input of the amplifier. If the L1 or L2 phase current exceeds the overcurrent alarm level, an alarm condition (with alarm code 01) occurs in the Power Supply.

Table 4.1.2 (b) IR and IS current conversion value

Model	Current conversion
αiPS 5.5	133A/1V(2.5 V at the center)
αiPS 11	133A/1V(2.5 V at the center)
αiPS 15	200A/1V(2.5 V at the center)
αiPS 26	266A/1V(2.5 V at the center)
αiPS 30	333A/1V(2.5 V at the center)
αiPS 37	400A/1V(2.5 V at the center)
αiPS 55	666A/1V(2.5 V at the center)
αiPS 11HV	100A/1V(2.5 V at the center)
αiPS 18HV	133A/1V(2.5 V at the center)
αiPS 30HV	200A/1V(2.5 V at the center)
αiPS 45HV	266A/1V(2.5 V at the center)
αiPS 60HV	333A/1V(2.5 V at the center)
αiPS 75HV	400A/1V(2.5 V at the center)
αiPS 100HV	466A/1V(2.5 V at the center)

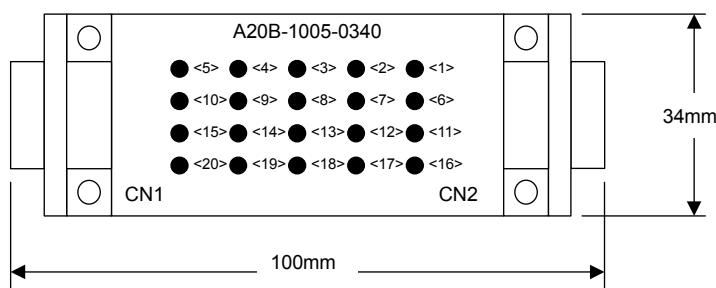

About the servo check pin board A06B-6071-K290

The servo check pin board can be used to observe signals in the Power Supply.

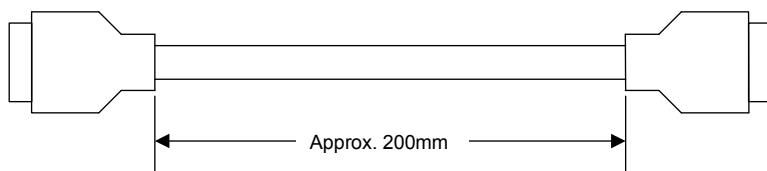

(1) Specification

Order specification	Description	Remark
A06B-6071-K290	Printed-circuit board A20B-1005-0340	Printed-circuit board with check pins mounted
	Cable A660-2042-T031#L200R0	20-conductor one-to-one cable Length : 200mm

Printed-circuit board : A20B-1005-0340

Cable : A660-2042-T031#L200R0

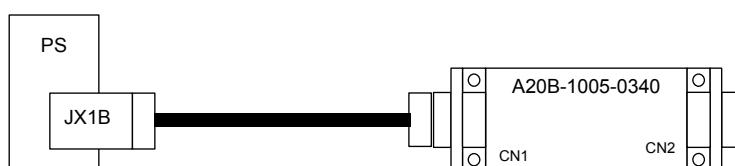

One-to-one wiring is provided between CN1 and CN2.

The connector pin numbers correspond to the check pin numbers.

(2) Connection

Connect the cable to the connector JX1B at the front of the Power Supply.

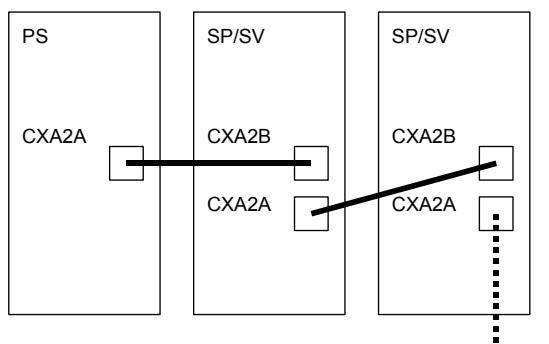

4.1.3 The PIL LED (Power ON Indicator) Is Off.

Table 4.1.3 Check method and action

No.	Cause of trouble	Check method	Action
1	AC power for the control circuit not supplied	Check that power is connected to connector CX1A.	
2	Blown fuse in the control circuit	Check whether F1 or F2 has blown. See Chapter 4 of Part II.	(1) If the AC power input for control is connected to connector CX1B by mistake, F2 (FU2) may blow. Connect the AC power input to CX1A. (2) Replace the fuse. If the fuse blows again after the replacement, replace the printed circuit board.
3	Incorrect wiring	Check whether the 24-V power output is short-circuited and whether a load exceeding the rating is connected.	
4	Faulty power supply circuit on the printed circuit board	The power-on LED indicator PIL operates on the +5-V power supply. Check the control power voltage.	Replace the printed circuit board, driver board, or power distribution board.

4.1.4 Checking Method when Magnetic Contactor Is not Switched On

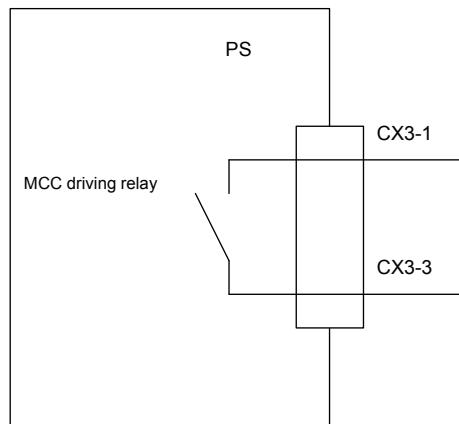

- (1) The system is still in an emergency stop status.
→ Check the connection.
- (2) There is a connector problem. ("-" blinks for about 2 seconds or "P" is displayed after an emergency stop status is released.)
 - (a) Check that the connectors are attached to correct locations.
→ Ensure that the connectors are attached to the location CXA2A on the Power Supply and the location CXA2B on the Spindle Amplifier/Servo Amplifier.

(Battery box for PulseCoder)

- (b) The interface cable between CXA2B of the Power Supply and CXA2A of the Servo Amplifier or Spindle Amplifier is defective.
→ Check whether the interface cable is faulty.
- (3) The power for driving the magnetic contactor is not supplied. ("-" blinks for about 2 seconds after an emergency stop status is released.)
→ Check the voltage across the both ends of the coil of the magnetic contactor.

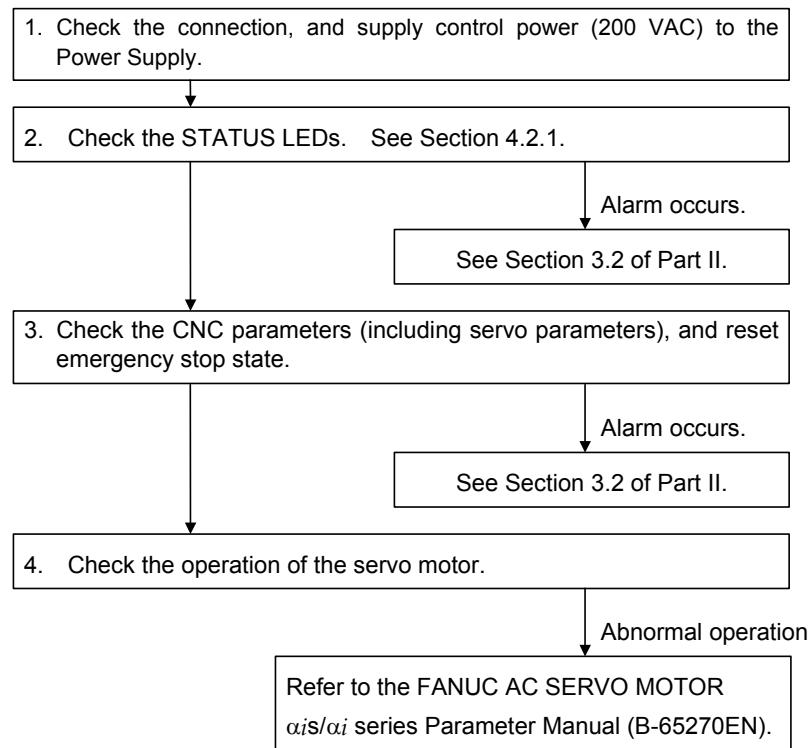

- (4) The relay for driving the magnetic contactor is defective. ("-" blinks for about 2 seconds after an emergency stop status is released.)
 → Check that a circuit between pins CX3-1 and CX3-3 of connector is closed and opened.

- (5) The Power Supply, Servo Amplifier, or Spindle Amplifier is defective.
 → Replace the defective module.

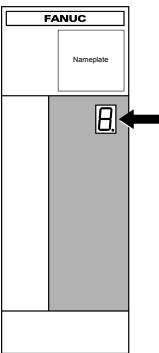

4.2 SERVO AMPLIFIER

Check each item according to the procedure described below.

4.2.1 Checking the STATUS Display (Servo Amplifier)

The STATUS display (a 7-segment LED) on the front of the Servo Amplifier indicates the operation status.

STATUS LED position	STATUS display	Description
		The STATUS LED is off. Control power has not been supplied, cable is faulty, or control power circuit is defective.
		The control power is short-circuited (- blinks). Cable failure
		Waiting for the READY signal from the CNC.
		Ready status The servo motor is excited.
		Alarm status The alarm type is indicated by the character displayed.

4.2.2 VRDY-OFF Alarm Indicated on the CNC Screen

When the VRDY-OFF alarm is indicated on the CNC, check the items listed below. In addition, VRDY-OFF can occur also for reasons other than listed below. If the following items turn out to have not caused VRDY-OFF, check diagnosis information No. 358 (V ready-off information) on the diagnosis screen and report it to FANUC.

- (1) Communication interface between amplifiers
Is the cable for the communication interface (CXA2A/B) between the amplifiers connected correctly?
- (2) Emergency stop signal (ESP)
Has the emergency stop signal (connector: CX4) applied to the Power Supply been released?
Alternatively, is the signal connected correctly?
- (3) MCON signal
Hasn't setting up the axis detach function disabled the transmission of the ready command signal MCON from the CNC to the Servo Amplifier?
- (4) Servo Amplifier control printed-circuit board
The Servo Amplifier control printed-circuit board may be poorly installed or faulty. Be sure to push the faceplate as far as it will go. If the problem persist, replace the control printed-circuit board.

On the Series 30i/31i/32i/16i/18i/21i/0i/PMi, checking diagnosis information (DGN) No. 358 makes it possible to analyze the cause of the VRDY-OFF alarm.

Diagnosis	358	V ready-off information
-----------	-----	-------------------------

Convert the displayed value to binary form, and check bits 5 to 14 of the resulting binary number.

When the servo amplifier starts working, these bits become 1 sequentially, starting at bit 5. When the servo amplifier has started normally, all of bits 5 to 14 become 1.

Check bits 5 to 14 sequentially, starting at the lowest-order bit. The first lowest bit that is not 0 corresponds to the processing that caused the V ready-off alarm.

#15	#14	#13	#12	#11	#10	#9	#8
	SRDY	DRDY	INTL	RLY	CRDY	MCOFF	MCONA
#7	#6	#5	#4	#3	#2	#1	#0
MCONS	*ESP	HRDY					

- #06(*ESP) : Emergency stop signal
- #07,#08,#09 : MCON signal (CNC → Servo Amplifier → Power Supply)
- #10(CRDY) : Power Supply preparation completed signal
- #11(RLY) : Relay signal (DB relay energized)
- #12(INTL) : Interlock signal (DB relay de-energized)
- #13(DRDY) : Amplifier preparation completed signal

The following table lists diagnosis information No. 358 values and main causes of problems. Do not insert or remove any connector when the power is on.

Diagnosis No. 358 value	Problem	Check item
417	The system is still in an emergency stop state.	(1) Check whether the emergency stop signal input to CX4 on the Power Supply has been released. (2) Check whether there is no problem with the connection or cable for the communication interface between the amplifiers. (3) Replace the Servo Amplifier.
993	The Power Supply preparation completed signal (CRDY) is not output.	(1) Check whether there is no problem with the connection or cable for the communication interface (CXA2A/B) between the amplifiers. (2) Check whether the input power is supplied. (3) Check whether the power is supplied to the operation coil of the magnetic contactor. Check whether there is no problem with the connection of CX3 on the Power Supply. (4) Replace the Servo Amplifier.
4065	The interlock signal is not input.	When a dynamic brake module (DBM) is used, check (1) to (4). When no DBM is used, replace the Servo Amplifier. (1) Check the connection between the Servo Amplifier and DBM. (2) Check the connection between the Power Supply and Servo Amplifier (CX1A/B). (3) Check whether the fuse (FU2) on the control printed-circuit board on the Power Supply has blown. (4) Replace the Servo Amplifier.
225	—	Replace the Servo Amplifier.
481	—	Replace the Servo Amplifier.
2017	—	Replace the Servo Amplifier.
8161	—	Replace the Servo Amplifier.
97	—	Check whether the axis detach function is set.

4.2.3 Method for Observing Motor Current

This subsection explains how to observe the current that flows through the servo motor.

(1) Method of using the SERVO GUIDE

Refer to online help for explanations about how to connect to and use the servo adjustment tool, SERVO GUIDE.

- Supported CNC systems

Series 30i/ 31i/32i -MODEL A (applied to 3.00 and subsequent editions of the SERVO GUIDE)

Series 16i/18i/21i -MODEL B

Series 0i-MODEL B, C, D (Series 0i-MODELD applied to 6.00 and subsequent editions of the SERVO GUIDE)

Power Mate i -MODEL D,H

Servo software supporting the αi series

4.CONFIRMATION OF THE

OPERATION

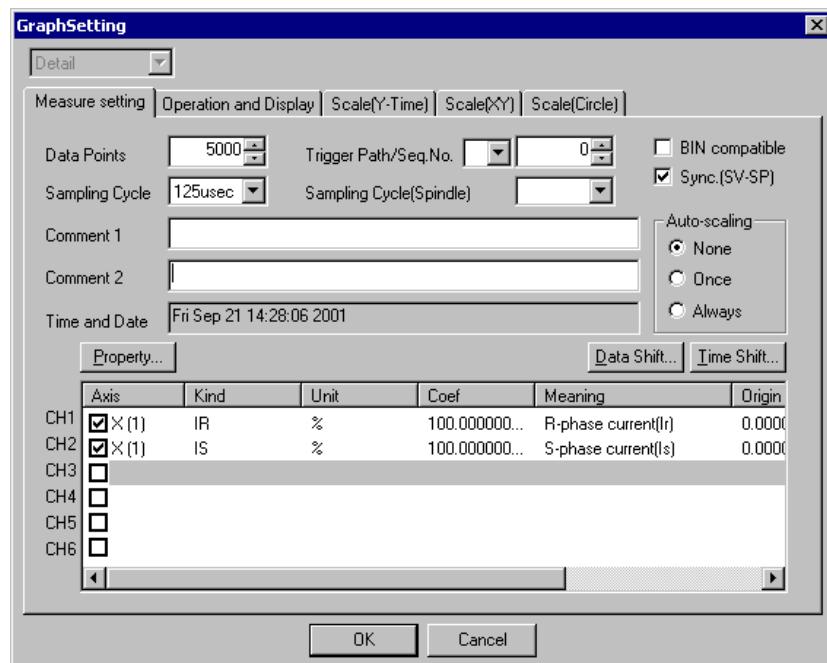

START-UP PROCEDURE

B-65285EN/04

90Dx/A(01) and subsequent editions, 90Ex/A(01) and subsequent editions, 90C5/A(01) and subsequent editions, 90B1/A(01) and subsequent editions, 90B5/A(01) and subsequent editions, 90B6/A(01) and subsequent editions, 90B0/L(12) and subsequent editions, 9096/C(03) and subsequent editions

- Setting

Select an axis to be subjected to measurement in graph window channel setting. Also select IR and IS under Kind. Under Coef (conversion coefficient), set the maximum allowable current (Ap) for the amplifier in use.

NOTE

- 1 Servo software series 90B0 supports setting of a motor current sampling period of up to 125 μ s.
- 2 Servo software series 9096 supports setting of a motor current sampling period of 1 ms only.

- Display

Select the XTYT mode from the graph window mode (M) menu to display waveforms.

(2) Method of using the servo check board

For details on how to connect and use the servo check board, refer to the following:

Appendix I in the FANUC AC SERVO MOTOR αi series Parameter Manual (B-65270EN)

For Series 30i/31i/32i and Series 0i-MODEL C, D, use the SERVO GUIDE because the servo check board cannot be connected and used.

- Required units

- Servo check board
A06B-6057-H630
- Oscilloscope

- Settings

· CNC setting

Parameter setting for servo software series 90B0

Output channel	Data number 5	Data number 6		
FS15 <i>i</i>	No.1726	No.1774	No.1775	No.1776
FS16 <i>i</i> /18 <i>i</i> /21 <i>i</i> /0 <i>i</i> /PM <i>i</i>	No.2115	No.2151	No.2152	No.2153
Measurement axis/ current phase	IR			IS
L-axis (Note 1)	370	0	402	0
M-axis (Note 1)	2418	0	2450	0

Parameter setting for servo software series 9096

Output channel	Data number 5	Data number 6	
FS16 <i>i</i> /18 <i>i</i> /21 <i>i</i> /0 <i>i</i> /PM <i>i</i>	No.2115		No.2115
Measurement axis/ current phase	IR		IS
L-axis (Note 1)	370	402	
M-axis (Note 1)	1010	1042	

When series 9096 is used, if no axis is paired with the measurement axis (Note 2), IR and IS cannot be observed simultaneously.

NOTE

- 1 The L-axis is an axis identified with an odd number set in parameter No. 1023. The M-axis is an axis identified with an even number set in parameter No. 1023.
- 2 The axis specified as 2n-1 in parameter No. 1023 and the axis specified as 2n will be in a pair.

Setting the output period of motor current data (for the 90B0 series only)

Output period	Parameter No. 1746 / Bit 7 of parameter No. 2206
Velocity loop period	0 (default)
Current loop period	1 (Note 3)

NOTE

- 3 If the current loop period is set up as the motor current data output period, selecting data number 0, 1, 2, or 4 disables the output of signals (such as a velocity command) to channels. To observe the motor current and other signals (such as a velocity command), specify the output period as 1 ms.
- 4 For the servo software series 9096, the output period of the motor current is only 1 ms. The current loop period cannot be used for output.

· Setting up the check board

- Set the AXIS digit of the LED display with an axis number from 1 to 8 specified in parameter No. 1023.
- Set the DATA digit of the LED display with a data number from 5 to 6.

- Method for observing the motor current

The voltage corresponding to the motor current is output to a channel for which 5 or 6 is set as the data number on the servo check board.

The waveform of the motor current can be observed by measuring the voltage mentioned above with an oscilloscope.

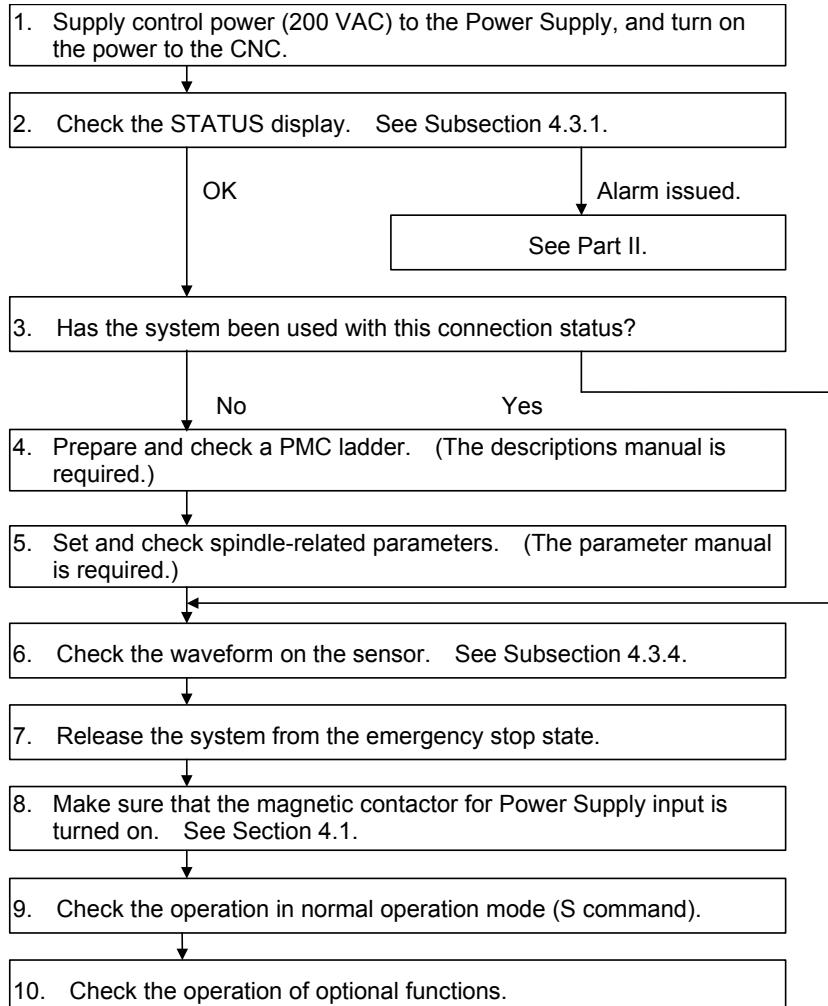

The following table lists the relationships between the observed voltage and the motor current.

Maximum amplifier current	Servo Amplifier type	Motor current/ observed voltage [A/V]
10A	αiSV 10HV and others	2.5
20A	αiSV 20 and others	5
40A	αiSV 40 and others	10
80A	αiSV 80 and others	20
160A	αiSV 160 and others	40
180A	αiSV 180HV and others	45
360A	αiSV 360 and others	90
540A	αiSV 540HV	135

For the Servo Amplifier1-20*i*, for example, the motor current is 5A (actual value rather than effective value) if the observed voltage is 1V.

4.3 SPINDLE AMPLIFIER

Check each item according to the procedure described below.

4.3.1 STATUS Display (Spindle Amplifier)

The STATUS display (a 7-segment LED) on the front of the Spindle Amplifier indicates the operation status.

STATUS LED position	STATUS display	Description
		The STATUS LED is off. Control power has not been supplied, cable is faulty, or control power circuit is defective.
		After control power is turned on, the spindle software series is displayed (for approx. 1 second). The last two digits of the spindle software series number are displayed.
		The spindle software version is displayed (for approx. 1 second following the display of the spindle software series). [Display] 01,02,03,... → [Version] A, B, C,...
		The CNC is not powered on (- - blinks). Waiting for serial communication and parameter loading completion.
		Parameter loading completed The motor is not excited.
		Ready status The spindle motor is excited.
		Alarm status The alarm type is indicated by the character displayed.
		Error status (invalid sequence or parameter setting error) The error type is indicated by the character displayed.

4.3.2 Troubleshooting at Startup

4.3.2.1 The PIL LED (power-on indicator) is off.

- When the PIL LED on the spindle amplifiers does not come on after the main circuit breaker is turned on

No.	Cause of trouble	Check method	Action
1	The 200-V control power is not supplied.	The Power Supply PIL lamp is off.	Check the cable attached to CX1A of Power Supply.
2	The cable is defective.	The Power Supply PIL lamp is on.	Check the cable attached to the connector CXA2A/B.
3	The power is externally connected to 0 V, GND, or the like.	When the connector is detached, the PIL lamp is on.	Replace or repair the cable.
4	There is a blown fuse on the printed circuit board.	Even when all cables except the cable attached to connector CX2A/B are detached, the PIL lamp does not come on.	If the fuse blows, the printed circuit board may be faulty. Replace the unit.
5	The printed circuit board is defective.		Replace the unit.

4.3.2.2 The STATUS display is blinking with "..."

- When no spindle communication alarm message is indicated on the CNC
Check whether the CNC software option setting or bit setting is correct.
- When a communication alarm message is indicated on the CNC

4.CONFIRMATION OF THE

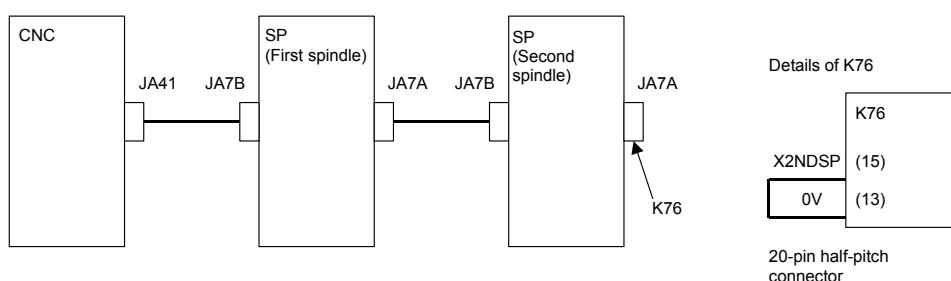

OPERATION

START-UP PROCEDURE

B-65285EN/04

No.	Cause of trouble	Check method	Action
1	The cable is incorrect.	Note that the cable used for connecting an electric/optical adapter and the cable connected directly to the CNC differ in specifications.	Replace the cable with a correct cable.
2	The cable is defective.	Check the connector housing section.	Repair or replace the cable.
3	The printed circuit board is defective.		Replace the unit.

- (3) When Dual Check Safety is in use, and No. 756 or 766 occurs on the CNC (FS16*i*)
 Check that K76, shown below, is mounted on the second spindle.
 If Dual Check Safety is not in use or the CNC has only the first spindle, K76 is unnecessary.

4.3.2.3 The motor does not turn.

- (1) When "--" is indicated on the STATUS display of the Spindle Amplifier
 Check whether spindle control signals are input. (An example for the first spindle is shown below.)

FS15 <i>i</i>	FS16 <i>i</i> FS0 <i>i</i> -B/C	FS30 <i>i</i> FS0 <i>i</i> -D	#7	#6	#5	#4	#3	#2	#1	#0
G227	G070	G070	MRDYA		SFRA	SRVA				
G226	G071	G071							*ESPA	
—	G029	G029		*SSTP						
—	G030	G030	SOV7	SOV6	SOV5	SOV4	SOV3	SOV2	SOV1	SOV0

- (2) When "00" is indicated on the STATUS display of the Spindle Amplifier
 No spindle speed command is input.
 Refer to Chapter 1 in "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)," and check related parameters.
- (3) When an alarm number is indicated on the Spindle Amplifier
 See the description of the alarm number in Part II.

4.3.2.4 A specified speed cannot be obtained.

- (1) When the speed always differs from a specified speed
 Check parameters.
 Refer to Chapter 1 in "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)," and check related parameters.

- (2) When an alarm number is indicated on the Spindle Amplifier
See the description of the alarm number in Part II.

4.3.2.5 When cutting is not performed, the spindle vibrates, making noise.

- (1) The spindle vibrates only when the spindle speed has reached or is at a particular speed level.
Check whether the spindle also vibrates when the motor is turning by inertia. If noise is unchanged, investigate the source of mechanical vibration. There are several methods to turn the spindle by inertia as explained below. Because these methods involve machine sequences, consult with the machine tool builder.
- Setting spindle control signal MPOF (FS16*i*: G73#2, FS15*i*: G228#2) to 1 immediately causes the spindle to turn by inertia.
 - Set ALSP (FS16*i*: bit 2 of parameter No. 4009, FS15*i*: bit 2 of parameter No. 3009) to 1. Then, when the power to the CNC is turned off during spindle rotation, the spindle turns by inertia. (On the spindle amplifier, Alarm 24 is indicated.)
- (2) When noise is generated at the time the motor is stopped or at any time
- See Subsection 4.3.4 of this part, and check and adjust the waveform of the spindle sensor.
 - Check that the motor part number matches its parameters. For details, refer to Appendix A in "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)."
 - Adjust the velocity loop gain and so forth.
For details, refer to Chapter 1 in "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)."

4.3.2.6 An overshoot or hunting occurs.

Refer to Chapter 1 in "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)," and adjust parameters.

4.3.2.7 Cutting power weakens or acceleration/deceleration slows down.

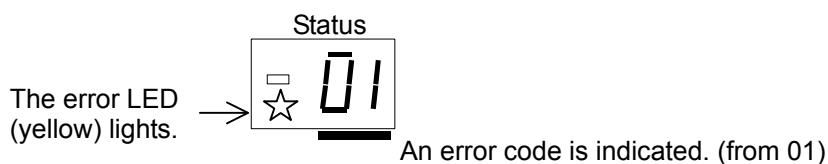

- (1) When the load meter does not indicate the maximum output
- A mechanical cause such as a belt slip may occur.
- (2) When the load meter indicates the maximum output
- Check whether the torque limit signal is input incorrectly.

FS15<i>i</i>	FS16<i>i</i> FS0<i>i</i>-B/C	FS30<i>i</i> FS0<i>i</i>-D	#7	#6	#5	#4	#3	#2	#1	#0
G227	G070	G070							TLMHA	TLMLA

- B. If you are using the *ai* BZ sensor, it is likely that a slip has occurred between the sensor gear and spindle (on acceleration).
- C. Check that the motor part number matches its parameters.
For details, refer to Appendix A in "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)."
- D. Check whether the output limit pattern is set incorrectly.
For details, refer to Chapter 1 in "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)."

4.3.3 Status Error Indication Function

When there is a sequence or parameter error, the error LED (yellow) in the display section of the Spindle Amplifier (SP) goes on with an error code displayed. This can ease troubleshooting at the time of machine startup.

The error code is also displayed on the CNC diagnosis screen.

Diagnosis No.			Description
FS15 <i>i</i>	FS16 <i>i</i>	FS30 <i>i</i> FS0 <i>i</i> -D	
1561	710(First spindle) 711(Second spindle) 730(Third spindle) 731(Fourth spindle)	710	Status error code

When the Spindle Amplifier does not operate for a certain function, check whether the status error is indicated in the display section of the Spindle Amplifier or CNC diagnosis screen.

No.	Description	Action
01	Although neither *ESP (emergency stop signal) (there are two types of signals, a PMC signal and Power Supply (PS) contact signal) nor MRDY (machine ready signal) has been input, SFR (forward rotation signal), SRV (reverse rotation signal), or ORCM (orientation command) is input.	Check the *ESP and MRDY sequences. For MRDY, pay attention to the parameter that specifies whether to use the MRDY signal (bit 0 of parameter No. 4001).
03	Although parameter settings are such that there is no position sensor (position control is not to be performed, that is, bits 3, 2, 1, and 0 of parameter No. 4002 are, respectively, 0, 0, 0, and 0), a Cs axis contour control command has been issued. In this case, the motor is not activated.	Check setting of the parameter.
04	Although parameter settings are such that there is no position sensor (position control is not to be performed, that is, bits 3, 2, 1, and 0 of parameter No. 4002 are, respectively, 0, 0, 0, and 0), a servo mode (such as rigid tapping or Cs axis control) command or spindle synchronization control command has been issued. In this case, the motor is not activated.	Check setting of the parameter.
05	Although optional parameter for the orientation function is not set, an ORCM (orientation command) is input.	Check setting of the parameter for orientation.
06	Although optional parameter for the output switching option is not set, low-speed winding is selected (RCH = 1).	Check setting of the parameter for output switching and the power line status signal (RCH).
07	Although Cs contour control mode is input, neither SFR (forward rotation signal) nor SRV (reverse rotation signal) is input.	Check the sequence.
08	Although servo mode (rigid tapping or spindle positioning) control command is input, neither SFR (forward rotation signal) nor SRV (reverse rotation signal) is input.	Check the sequence.

4.CONFIRMATION OF THE

No.	Description	Action
09	Although spindle synchronization control command is input, neither SFR (forward rotation signal) nor SRV (reverse rotation signal) is input.	Check the sequence.
10	Although Cs contour control command is input, another operation mode (servo mode, spindle synchronization, or orientation) is specified.	Do not specify another mode during execution of the Cs contour control command. Before entering another mode, cancel the Cs contour control command.
11	Although servo mode (rigid tapping or spindle positioning) is input, another operation mode (Cs contour control, spindle synchronization, or orientation) is specified.	Do not specify another mode during execution of the servo mode command. Before entering another mode, cancel servo mode.
12	Although spindle synchronization is input, another operation mode (Cs contour control, servo mode, or orientation) is specified.	Do not specify another mode during execution of the spindle synchronization command. Before entering another mode, cancel the spindle synchronization command.
13	Although orientation specification is input, another operation mode (Cs contour control, servo mode, or synchronization control) is specified.	Do not specify another mode during execution of the orientation command. Before entering another mode, cancel the orientation command.
14	The SFR (forward rotation signal) and SRV (reverse rotation signal) are input at the same time.	Input one of the SFR and SRV signals.
16	Although the parameter not to use the differential speed control function (bit 5 of parameter No. 4000 = 0) is set, DEFMD (differential speed mode command) is input.	Check the setting of the parameter and the differential speed mode command.
17	The parameter settings for the speed detector (bits 2, 1, and 0 of parameter No. 4011) are invalid. There is no speed detector that matches the settings.	Check the setting of the parameter.
18	Although parameter settings are such that there is no position sensor (position control is not to be performed, that is, "bits 3, 2, 1, and 0 of parameter No. 4002 are, respectively, 0, 0, 0, and 0," a position coder-based orientation command has been issued.	Check the setting of the parameter and the input signal.
19	Although magnetic sensor orientation command is input, another operation mode (Cs contour control, servo mode, or spindle synchronization) is specified.	Do not specify another mode during execution of the orientation command. Before entering another mode, cancel the orientation command.
21	The tandem operation command was input in the spindle synchronization control enable state.	Input the tandem operation command when spindle synchronization control is canceled.
22	Spindle synchronization control was specified in the tandem operation enable state.	Specify spindle synchronization control when torque tandem operation is canceled.
23	The tandem operation command is input without the required option.	Torque tandem control requires a CNC software option. Check the option.
24	Although continuous indexing in position coder-based orientation is to be performed, an absolute position command (INCMD = 0) has been issued after incremental operation (INCMD = 1).	Check the INCMD (incremental command). Be sure to perform absolute position command-based orientation before an absolute position command.
26	The parameter settings are such that both spindle switch and three-stage speed range switch are used.	Check the parameter settings and the input signal.
29	Parameter settings are such that the shortest-time orientation function is to be used (bit 6 of parameter No. 4018 is 0 and parameter Nos. 4320 to 4323 are nonzero).	The shortest-time orientation function cannot be used in the <i>ai</i> series spindle amplifier. The use of the optimum orientation function is recommended.

4.CONFIRMATION OF THE

OPERATION

START-UP PROCEDURE

B-65285EN/04

No.	Description	Action
30	The magnetic pole has not been detected, but a command is input.	In the magnetic pole undetected state (EPFIXA = 0), the motor cannot be driven even when a command is input. Input a command in the magnetic pole detected state (EPFIXA = 1). When EPFSTR is set to 1, any command is ignored and this error is displayed even in the magnetic pole detected state. After the completion of magnetic pole detection, set EPFSTR to 0.
31	This hardware configuration does not support the use of the spindle FAD function. In this case, the motor is not activated.	Check the CNC model.
32	S0 is not specified in the velocity mode, but the disturbance input function is enabled (bit 7 of parameter No. 4395 is set to 1).	Specify S0 in the velocity mode before enabling the disturbance input function (bit 7 of parameter No. 4395 to 1).
33	This hardware configuration does not support the use of the spindle EGB function. In this case, the motor is not activated.	Check the CNC model.
34	Both spindle FAD function and spindle EGB function are enabled. In this case, the motor is not activated.	These functions cannot be used at the same time. Enable only one of the functions.
35	Spindle Amplifier (SP) ID information cannot be obtained.	Replace the spindle amplifier with one with correct ID information.
36	The submodule SM (SSM) is faulty . 1) The interface signal between the Spindle Amplifier and SSM is disconnected. 2) SSM failure	For the action to be taken for this status error, refer to Section 1.4, "Submodule SM," in Part IV in the FANUC AC SPINDLE MOTOR αi series Parameter Manual.
37	The current loop setting (No. 4012) has been changed.	Check the setting of parameter No. 4012, and turn the power off, then on again.
38	A parameter related to communication between spindle amplifiers is specified incorrectly. Alternatively, a function unavailable with the torque tandem function is set.	Check the parameters.
39	Although SFR (forward rotation command), SRV (reverse rotation command), or ORCM (orientation command) is input, DSCN (disconnection detection disable signal) is input.	Check the sequence. Do not input DSCN (disconnection detection disable signal) during the input of a command which excites the motor.
43	A setting which does not support the αiCZ sensor (serial) is used.	Check the parameter settings.
44	The spindle amplifier does not support the control period setting.	Check the setting of parameter No. 4012.

NOTE

- *1 When status error 43 is displayed, check the following items. The items to be checked differ depending on the series and edition of the spindle software.
- Series 9D80 edition E (edition 05) or edition F (edition 06): Items <1> to <12>
- Series 9D80 edition G (edition 07): Items <1> to <9>, <12>, and <13>
- Series 9D80 edition H (edition 08): Items <1> to <9>, <13>, and <14>
- (1) For both the motor sensor and spindle sensor, the setting is made to use an αiCZ sensor (serial). (No.4010#2,1,0=0,1,0 and No.4002#3,2,1,0=0,1,1,0)
 - (2) Spindle HRV control is not set. (No.4012#7=0)
 - (3) The setting is made to use the differential speed control function. (No.4000#5=1)
 - (4) The setting is made to use the spindle switch control function. (No.4014#0=1)
 - (5) The setting is made so that an alarm related to position feedback is not detected. (No.4007#6=1 or No.4016#5=0)
 - (6) The setting is made so that the disconnection of the feedback signal is not detected. (No.4007#5=1)
 - (7) The setting is made so that an alarm related to position signal feedback is not detected during thread cutting. (No.4016#5=0)
 - (8) The setting is made to use an external one-rotation signal. (No.4004#2=1)
 - (9) The setting is made to use a position coder. (No.4002#3,2,1,0=0,0,1,0)
 - (10) The setting is made to drive a synchronous spindle motor. (No.4012#6=1)
 - (11) The setting is made to use communication between Spindle Amplifiers. (No.4352#7=1 or No.4352#6=1)
 - (12) The setting is made to use the Dual Check Safety function.
 - (13) The setting is made to use the spindle tandem function. (No.4015#3=1)
 - (14) Although the setting is made to use an αiCZ sensor (serial) as the motor sensor, the Dual Check Safety function is enabled.

4.3.4 Checking the Feedback Signal Waveform

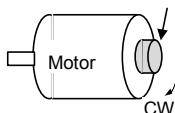

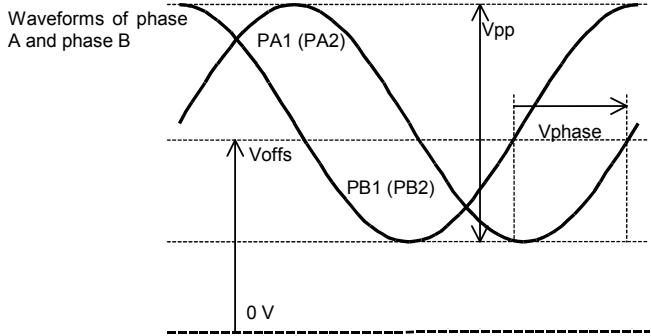

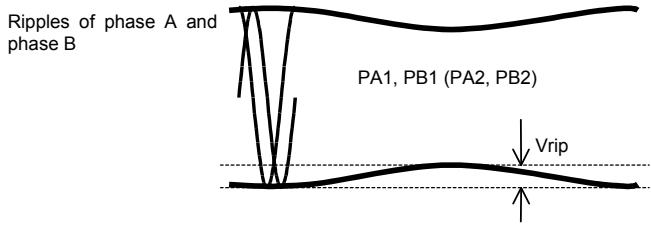

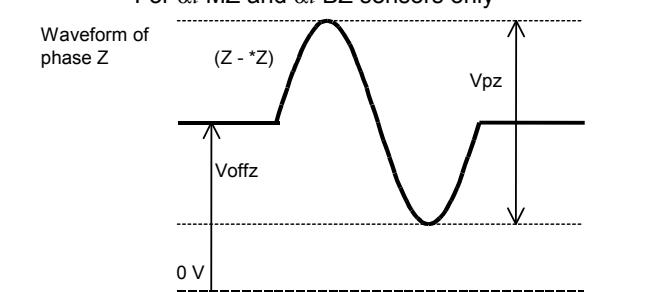

The measurement locations and the method for attaching connectors vary depending on the configuration of the detector. Check the waveform while seeing Table 4.3.4. The check terminals are on the check board.

Table 4.3.4(a) Signals input to the Spindle Amplifier and corresponding check terminals on the check board

Check terminal name	Spindle Amplifier input signal (connector name-pin No.)	Main sensors	Remarks
PA1 PB1	JYA2-pin5,6 JYA2-pin7,8	$\alpha i M$, $\alpha i MZ$, and $\alpha i BZ$ sensors Analog $\alpha i CZ$ sensor	
PA2 PB2	JYA4-pin5,6 JYA4-pin7,8	$\alpha i BZ$ sensor Analog $\alpha i CZ$ sensor α position coder S(1024 λ)	For TYPE B only
PS1	JYA2-pin1,2	$\alpha i MZ$ and $\alpha i BZ$ sensors (one-rotation signal) Analog $\alpha i CZ$ sensor (one-rotation signal)	
PS2	JYA4-pin1,2	$\alpha i BZ$ sensor (one-rotation signal) Analog $\alpha i CZ$ sensor (one-rotation signal)	For TYPE B only
EXTSC1	JYA3-pin15	Proximity switch (external one-rotation signal)	

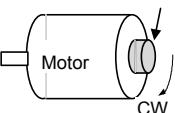

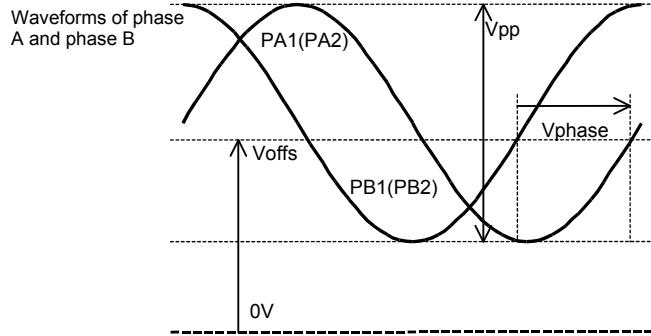

For the α position coder and α position coder S (one-rotation signal), observe the Spindle Amplifier input signal directly, using the servo check pin board A06B-6071-K290.

4.3.4.1 αi M sensor, αi MZ sensor, and αi BZ sensor

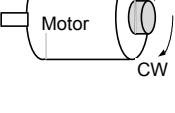

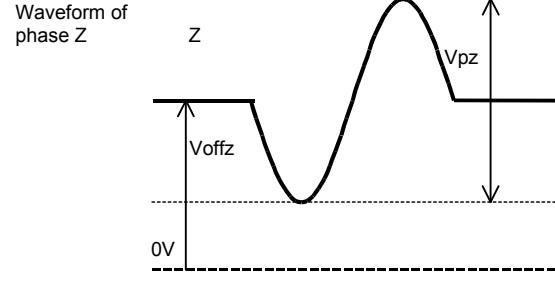

Measurement location	Measurement condition	Sample waveform
PA1, PB1 Separate sensors PA2, PB2	The speed must be 1500 min ⁻¹ or less. Rotation direction: CW Detection gear 	<p>Waveforms of phase A and phase B</p>  <p>Ripples of phase A and phase B</p>  <p>For αi MZ and αi BZ sensors only</p> <p>Waveform of phase Z</p> 
PS1 Separate sensor PS2		

Measurement item	Specification	Measurement method	Adjustment method
Vpp	0.5 to 1.2 Vp-p		
Voffs, Voffsz	2.5 V \pm 100 mV	Use the DC range of a digital voltmeter.	Normally, the αi M and αi MZ sensors need not be adjusted. For Voffs and Voffz, only level check is possible, but adjustment is not possible.
Vphase	90 \pm 3°		
Vrip	< 70 mV		
Vpz	> 0.5 V		

4.3.4.2 Analog αi CZ sensor

Measurement location	Measurement condition	Sample waveform
PA1, PB1 Separate sensors PA2, PB2	Speed: 500min ⁻¹ Rotation direction: CW Detection gear 	Waveforms of phase A and phase B 

Measurement item	Specification	Measurement method	Adjustment method
Vpp	0.9 to 1.1V p-p		The sensors are adjusted at shipment. Do not adjust the sensors, or the detection precision is affected.
Voffs	2.5V ± 50mV	Use the DC range of a digital voltmeter.	

Measurement location	Measurement condition	Sample waveform
PS1 Separate sensor PS2	Speed: 500min ⁻¹ Rotation direction: CW Detection gear 	Waveform of phase Z 

Measurement item	Specification	Measurement method	Adjustment method
Vpz	0.66 to 1.65V p-p		The sensors are adjusted at shipment. Do not adjust the sensors, or the detection precision is affected.
Voffsz	2.5V ± 50mV	Use the DC range of a digital voltmeter.	

NOTE

For how to check the serial output αi CZ sensor signals, refer to the technical report of the relevant sensor.

4.3.4.3 α position coder S

Measurement location	Measurement condition	Sample waveform
PA2, PB2	CW rotation direction as viewed from the flange	<p>Waveforms of phase A and phase B</p> <p>PA1 (PA2)</p> <p>PB1 (PB2)</p> <p>Vpp</p> <p>Voffs</p> <p>0 V</p> <p>Waveform of phase Z</p> <p>(Z - *Z)</p> <p>0V</p>

Measurement item	Specification	Measurement method	Adjustment method
Vpp	0.8 to 1.2 Vp-p		
Voffs, Voffsz	$2.5 \text{ V} \pm 100 \text{ mV}$	Use the DC range of a digital voltmeter.	Only level check is possible, but adjustment is not possible.
Vphase	$90 \pm 5^\circ$		

4.3.5 Spindle Check Board

When connecting the check board, you can:

- <1> Observe signal waveforms.
- <2> Observe internal data.
- <3> Check spindle parameter values.

You can perform the above more easily by using the SERVO GUIDE. For information about the SERVO GUIDE, see Subsection 4.3.8.

4.3.5.1 Spindle check board specifications

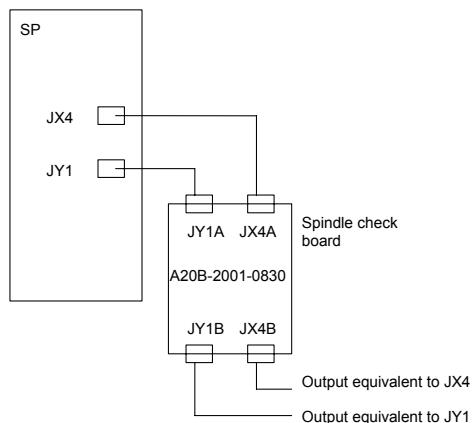

Spindle check board specifications is bellow.

Table 4.3.5.1 Spindle check board specifications

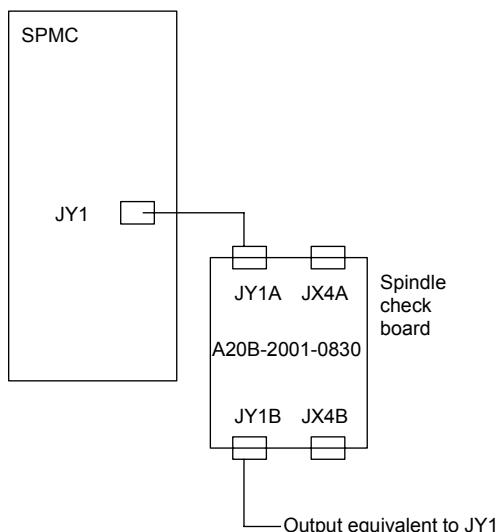

Specification	Drawing No. of printed circuit board	Applicable unit
A06B-6078-H001	A20B-2001-0830	αi series, αCi series (having the same specification as for the α series)

4.3.5.2 Check board connection

(1) αi series

(2) αCi series

4.3.5.3 Check terminal output signals

(1) αi series

Check terminal	Signal name	Check terminal	Signal name
LM	Load meter signal	PA1	Phase A sine wave signal 1
SM	Speedometer signal	PB1	Phase B sine wave signal 1
CH1	Analog output for internal data observation (Phase U current: IU)	PS1	Phase Z sine wave signal 1
CH2	Analog output for internal data observation (Motor speed TSA: $1638 \text{ min}^{-1}/\text{V}$)	PA2	Phase A sine wave signal 2 (TYPE B)
CH1D	Output for internal data bit observation	PB2	Phase B sine wave signal 2 (TYPE B)
CH2D	Output for internal data bit observation	PS2	Phase Z sine wave signal 2 (TYPE B)
VRM	Disuse	PA3	Disuse
LSA1	Disuse	PB3	Disuse
EXTSC1	External one-rotation signal (main)	PA4	Disuse
LSA2	Disuse	PB4	Disuse

PSD	Disuse	-15V	Disuse
		GND	0 V

Check terminal arrangement

4.3.6 Observing Data Using the Spindle Check Board

4.3.6.1 Overview

By using the check board, you can convert digital signals used for control in the Spindle Amplifier to analog voltage, and observe the conversion result with an oscilloscope. For internal data observation, you can use CH1 and CH2 (output: -5 to +5 V) as the two-channel analog output, and CH1D and CH2D as the output for checking specific bits of bit data or the like. You can also view internal data on the five-digit indicator.

4.3.6.2 Major characteristics

Item		
Measurement point	CH1, CH2	CH1D, CH2D
Output voltage range	-5 to +5 V	H: 2 Vmin L: 0.8 Vmax
Resolution	About 39 mV (10 V/256)	-
Output impedance	10 kΩmin	10 kΩmin

4.3.6.3 Observation method

By setting data using four DIP switches on the check board, you can output internal data to the five-digit display, analog voltage output circuit, channels 1 and 2 (LM and SM or CH1 and CH2).

Data on channels 1 and 2 is the one from an 8-bit D/A converter.

The correspondence between channel 1/2 and the check terminal is listed below.

Measurement point	Check terminal
Channel 1	CH1 CH1D, data bit 0
Channel 2	CH2 CH2D, data bit 0

4.3.6.4 Specifying data to be monitored

- <1> Press the four setting switches at the same time for at least a second ."FFFFF" will be displayed on the indicator.
- <2> Turn off the switches and press the "MODE" switch. "d-00" will be displayed on the indicator and the system will enter the mode for monitoring internal data.
- <3> In this mode, the motor can be operated normally.
Press the "UP" or "DOWN" switch while holding down the "MODE" switch. The indicator display will change in the range of "d-00" to "d-12".
- <4> The following shows the correspondence between the destinations of the internal data of the serial spindle and addresses d-01 to d-12.
- d-01 to d-04 : Specifies the amount of data to be output to the indicator, data shift, and output format (decimal or hexadecimal).
 - d-05 to d-08 : Specifies the amount of data to be output to the channel 1, data shift, and whether an offset is provided.
 - d-09 to d-12 : Specifies the amount of data to be output to the channel 2, data shift, and whether an offset is provided.
- <5> Select address d-xx in the procedure for setting data described in <3>.
- <6> Turn off the "MODE" switch. "d-xx" will disappear 0.5 second later, and the data will be displayed for a second.
Change the set data using the "UP" or "DOWN" switch within the second the data is displayed.
- <7> When more than a second elapses without pressing the "UP" or "DOWN" switch, data cannot be changed.
If the "MODE" switch is turned on or off, however, setting can be started from the beginning of the step in item <6>.

4.3.6.5 Address descriptions and initial values (Spindle Amplifier)

[Output to the indicator]

Address	Description	Initial value
d-01	Specifies a data number.	0
d-02	Shift at data output (0 to 31 bits)	0
d-03	Data shift direction 0 : Data is shifted right. 1 : Data is shifted left.	0
d-04	Display format 0 : Decimal notation 1 : Hexadecimal notation(0 to F)	0

[Output to the channel 1]

Address	Description	Initial value
d-05	Specifies a data number	218 (U-phase current)
d-06	Shift at data output (0 to 31 bits)	8
d-07	Data shift direction 0: Data is shifted right 1: Data is shifted left	0
d-08	Offset 0: Not provided 1: Provided	1

[Output to the channel 2]

Address	Description	Initial value
d-09	Specifies a data number	19 (Motor velocity)
d-10	Shift at data output (0 to 31 bits)	18
d-11	Data shift direction 0: Data is shifted right 1: Data is shifted left	0
d-12	Offset 0: Not provided 1: Provided	1

4.3.6.6 Principles in outputting the internal data of the serial spindle

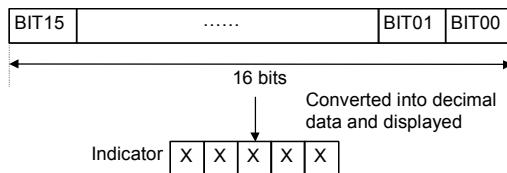

The length of data is 32 bits (BIT31 TO BIT00) unless it is described as 16 bits.

(1) Example of output to the indicator

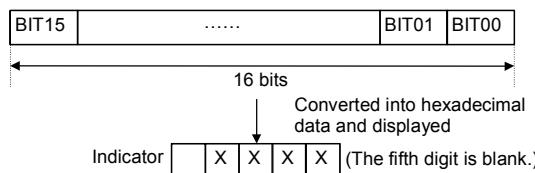

Example1: Displaying data in decimal

When the number of digits to shift data (d-02)=0 and display format (d-04)=0 (decimal notation): The last 16 bits of data (BIT15 to BIT00) are converted into decimal (0 to 65535 max.) and displayed.

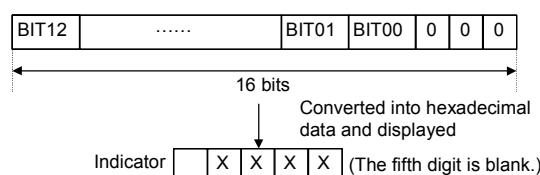

Example2: Displaying data in hexadecimal

When the number of digits to shift data (d-02)=0 and display format (d-04)=1 (hexadecimal notation): The last 16 bits of data (BIT15 to BIT00) are converted into hexadecimal (0 to FFFF max.) and displayed.

Example3: Shifting data left

When the number of digits to shift data (d-02)=3, the shift direction is left (d-03=1), and display format (d-04)=1 (hexadecimal notation): Data in BIT12 to BIT00 and the last three bits of data (=0) are converted into hexadecimal (0 to FFFF max.) and displayed.

4.CONFIRMATION OF THE

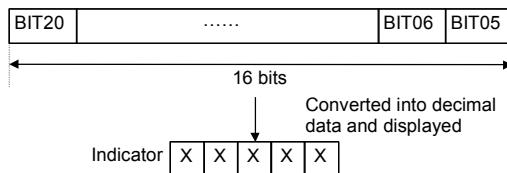

OPERATION

START-UP PROCEDURE

B-65285EN/04

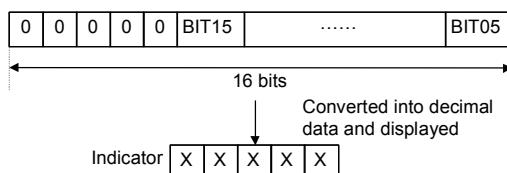

Example4: Shifting data right

When the number of digits to shift data (d-02)=5, shift direction is right (d-03=0), and display format (d-04)=0 (decimal notation): Data in BIT20 to BIT05 is converted into decimal (0 to 65535 max.) and displayed.

Example5: Shifting data right when the data length is 16 bits

When the data length is 16 bits, data shift (d-02)=5, shift direction is right (d-03=0), and display format is decimal notation (d-04=0): The first five bits of data and data in BIT15 to BIT05 are converted into decimal and displayed.

(2) Example of output to the channel 1

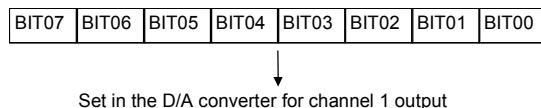

Internal data is output to channel 1 by setting it in an 8-bit D/A converter.

The D/A converter output ranges from -5 to +5 V, depending on a set value of internal data. See the table below.

Internal data in binary (decimal)	Setting d-08 (whether there is offset)	Output on channel 1
00000000 (0)	0	-5V
11111111 (255)	0	+4.96V
10000000 (-128)	1	-5V
00000000 (0)	1	0V
01111111 (127)	1	+4.96V

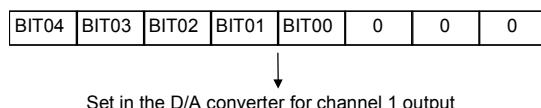

Example1: Data set

When the number of digits to shift data (d-06)=0 and when no offset is provided (d-08=0): The last eight bits of data (BIT07 to BIT00) is set in the D/A converter of the LM terminal.

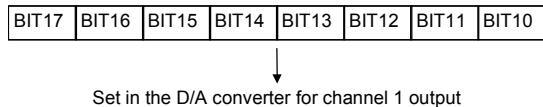

Example2: Shifting data left

When the number of digits to shift data (d-06)=3, shift direction is right (d-07=1), and no offset is provided (d-08=0): Data in BIT14 to BIT00 and the last three bits of data (=0) are set in the D/A converter.

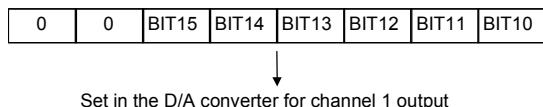

Example3: Shifting data right

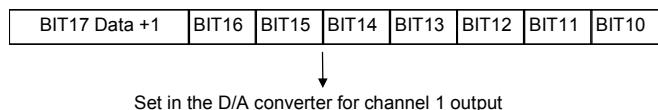

When the number of digits to shift data (d-06)=10, shift direction is right (d-07=1), and no offset is provided (d-08=0): Data in BIT17 to BIT10 is set in the D/A converter.

**Example4: Shifting data right when the data length is 16 bits**

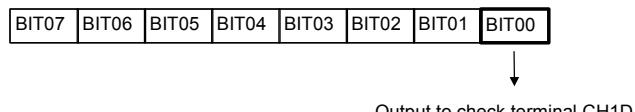

When the data length is 16 bits, data shift (d-06)=10, shift direction is right (d-07=0), and no offset is provided (d-08=0): The first two bits of data (=0) and data in BIT15 to BIT10 are set in the D/A converter.

**Example5: If an offset is provided**

When the number of digits to shift data (d-06)=10, shift direction is right (d-07=0), and an offset is provided (d-08=1): Data in most significant bit BIT17 (to which 1 is added) and data in BIT16 to BIT10 are set in the D/A converter.

**Example6: Data bit observation**

For data shift (d-06) = 0 with no offset (d-08 = 0), the lowest data bit (BIT00) can be observed as a high/low level at check terminal CH1D.

**(3) Example of output to the channel 2**

Output to the channel 2 is the same as that to the channel 1. However, the addresses for setting data (d-09 to d-12) are different from those for output to the channel 1.

Setting velocity information in the channel 1 and the number of errors in the channel 2 enables simultaneous monitoring of the change in each data item using the two channels.

4.3.6.7 Data numbers**(1) Data numbers**

Data No.	Description	Data length	Remarks
Main data			
16	Motor speed command	32	The 12th bit (BIT12) indicates a units in min ⁻¹ .
19	Motor speed	32	The 12th bit (BIT12) indicates a units in min ⁻¹ . (An estimated value is used for the αCi series.)
25	Motor speed deviation	32	(Speed command - motor speed) The 12th bit (BIT12) indicates a units in min ⁻¹ .
4	Move command	32	Number of command pulses for ITP (usually 8 ms)

OPERATION

START-UP PROCEDURE

B-65285EN/04

Data No.	Description	Data length	Remarks
Main data			
9	Positioning error	32	Number of erroneous pulses (Spindle synchronous control, Cs contour control, Rigid tapping mode)
90	Torque command	16	0 to ± 16384
131	Speedometer data	16	SM terminal
132	Load meter data	16	LM terminal
136	Position error	32	Number of erroneous pulses (Position coder orientation)
Data between the spindle and CNC			
5	Speed command data	16	± 16384 for the maximum speed command
6	Spindle control signal 1	16	See the command signal from the PMC to spindle in (3).
10	Load meter data	16	+32767 for maximum output
11	Motor speed data	16	± 16384 for maximum speed
12	Spindle status signal 1	16	See the status signal from the spindle to PMC in (3).
66	Spindle control signal 2	16	See the command signal from the PMC to spindle in (3).
182	Spindle status signal 2	16	See the status signal from the spindle to PMC in (3).
Other data			
218	Phase U current (A/D conversion data)	16	10 V/FS by shifting 8 bits left
219	Phase V current (A/D conversion data)	16	
162	DC link voltage	16	1000 V/FS by shifting 8 bits left

(2) Internal data conversion

Data No.	Signal name	Description (All are voltage values on check pins when the shift amount is 8.)	
218	IU	Phase U current	The current is positive when it is input to the amplifier. (*1)
219	IV	Phase V current	
162	VDC	DC link voltage signal 100V/1V (200 V system) 200V/1V (400 V system)	

*1 Current conversion result for channels 218 and 219

Model	Conversion result
αiSP 2.2	16.7A/1V
αiSP 5.5	
αiSP 11	33.3A/1V
αiSP 15	50.0A/1V
αiSP 22	66.7A/1V
αiSP 26	100A/1V
αiSP 30	133A/1V
αiSP 37	
αiSP 45	150A/1V
αiSP 55	233A/1V
αiSP 5.5HV	16.7A/1V
αiSP 11HV	
αiSP 15HV	33.3A/1V
αiSP 30HV	50.0A/1V
αiSP 45HV	66.7A/1V
αiSP 75HV	133A/1V
αiSP 100HV	150A/1V

(3) About the spindle control and spindle status signals

Shown below are the data numbers for the PMC signals used by the spindle and the configuration of each data item. Refer to Chapter 3, "PMC Signals (CNC \leftrightarrow PMC)" of "FANUC AC SPINDLE MOTOR αi series PARAMETER MANUAL" (B-65280EN) for explanations about each signal.

4.3.7 Checking Parameters Using the Spindle Check Board

4.3.7.1 Overview

By using the check board, you can check parameter values transferred to the Spindle Amplifier. Specify parameter numbers using the four setting switches on the check board, and check parameter values on the five-digit indicator.

4.3.7.2 Checking parameters

- <1> Press the four setting switches at the same time for at least one second. "FFFFF" will be displayed on the indicator.
- <2> Turn off the switches and press the "MODE" switch. "d-00" will be displayed on the indicator and the system will enter the mode for measuring internal data.
- <3> With "0" set for "d-00", press the "MODE" and "DATA SET" switches at the same time for at least one second. "CCCCC" will be displayed on the indicator.
- <4> Turn off the switches and press the "MODE" switch. "F-xxx" will be displayed on the indicator and the system will enter the mode for checking spindle parameters (F-mode). (Even in this mode, the motor can be operated normally.)
- <5> Press the "UP" or "DOWN" switch while holding down the "MODE" switch (with "F-xxx" displayed). The number of "F-xxx" increases or decreases. Set the internal number of a parameter you want to check. For correspondences between the parameter internal numbers and NC parameter numbers, see the parameter list in the appendix to the parameter manual.
- <6> Turn off the switches. The parameter value corresponding to the set internal number is displayed for about one second. (Bit parameter values are displayed in hexadecimal.)

4.3.8 Observing Data Using the SERVO GUIDE

4.3.8.1 Overview

Using the servo adjustment tool, SERVO GUIDE, enables you to observe internal data for the spindle. This subsection describes the spindle data that can be observed using the SERVO GUIDE. It also presents examples of observed data. Refer to online help for detailed explanations about how to use the SERVO GUIDE.

4.3.8.2 Usable series and editions

- Series 9D50/B(02) and subsequent editions
- Series 9D53/A(01) and subsequent editions
- Series 9D70/A(01) and subsequent editions
- Series 9D80/A(01) and subsequent editions
- Series 9D90/A(01) and subsequent editions
- Series 9DA0/A(01) and subsequent editions

4.3.8.3 List of spindle data that can be observed using the SERVO GUIDE

The following table lists the spindle data that can be observed using the SERVO GUIDE.

Data type	Description
SPEED	Motor speed
INORM	Motor current amplitude
TCMD	Torque command
VCMD	Motor speed command
VERR	Speed deviation
ERR	Position error (9D50/11 and subsequent editions *1)
ERRC	Position error (CNC)
ORERR	Position error at orientation
WMDAT	Move command for an individual position loop
SYNC	Synchronization error (9D50/11 and subsequent editions *1)
PCPOS	Cumulative position feedback value
MCMD	Move command for an individual communication cycle
ERR2	Position error 2
ERR2C	Position error 2(CNC) (9D50/11 and subsequent editions *1)
CSPOS	Cumulative position feedback value
SPCMD	Speed command data from the CNC
SPSPD	Spindle speed (9D50/11 and subsequent editions *1)
SPCT1	Spindle control signal 1
SPCT2	Spindle control signal 2
SPCT3	Spindle control signal 3 (9D50/11 and subsequent editions *1)
SPST1	Spindle status signal 1
SPST2	Spindle status signal 2
ORSEQ	Orientation sequence data
SFLG1	Spindle flag 1 (9D50/11 and subsequent editions *1)
SPPOS	Spindle position data (9D50/12 and subsequent editions *2)
LMDAT	Load meter data 1 (9D50/11 and subsequent editions *1)
DTRQ	Spindle load torque (Unexpected disturbance torque detection function) 1 (9D50/11 and subsequent editions *1)
FREQ	Frequency of disturbance torque (Disturbance input function) 1 (9D50/11 and subsequent editions *1)
GAIN	Gain data (Disturbance input function) 1 (9D50/11 and subsequent editions *1)
MTTMP	Motor winding temperature 1 (9D50/11 and subsequent editions *1)
MFBDF	Motor sensor feedback incremental data 1 (9D50/11 and subsequent editions *1) (For amplitude ratio and phase difference compensation)
SFBDF	Spindle sensor feedback incremental data 1 (9D50/11 and subsequent editions *1) (For amplitude ratio and phase difference compensation)
PA1	AD data 1 of A phase of motor sensor (9D50/11 and subsequent editions *1)
PB1	AD data 1 of B phase of motor sensor (9D50/11 and subsequent editions *1)
PA2	AD data 1 of A phase of spindle sensor (9D50/11 and subsequent editions *1)
PB2	AD data 1 of B phase of spindle sensor (9D50/11 and subsequent editions *1)
VDC	DC link voltage 1 (9D50/11 and subsequent editions *1)
SFERR	Semi-full error 1 (Dual position feedback) (9D50/11 and subsequent editions *1)
SMERR	Semi-closed side error 1 (Dual position feedback) (9D50/11 and subsequent editions *1)
SPACC	Spindle acceleration data 1 (9D50/20 and subsequent editions *4)

4.CONFIRMATION OF THE

OPERATION

START-UP PROCEDURE

B-65285EN/04

NOTE

- *1 Available with 9D53/03 and subsequent editions for series 9D53, 9D70/02 and subsequent editions for series 9D70, 9D80/01 and subsequent editions for series 9D80, and 9D90/01 and subsequent editions for series 9D90.
- *2 Available with 9D53/04 and subsequent editions for series 9D53, 9D70/03 and subsequent editions for series 9D70, 9D80/01 and subsequent editions for series 9D80, and 9D90/0 and subsequent editions for series 9D90.
- *3 To observe data marked with *1 and *2, the SERVO GUIDE Ver. 3.0 or later is required.
- *4 Available with 9D70/10 and subsequent editions for series 9D70, 9D80/04 and subsequent editions for series 9D80, and 9D90/01 and subsequent editions for series 9D90.
To observe this data, the SERVO GUIDE Ver. 4.10 or later is required.

4.3.8.4 About the spindle control and spindle status signals

As stated in the previous item, the SERVO GUIDE can be used to observe the PMC signals (spindle control signals 1 and 2 and spindle status signals 1 and 2) used by the spindle.

Listed below is the data configuration for spindle control signals 1 and 2 and spindle status signals 1 and 2. Refer to Chapter 3, "PMC Signals (CNC ↔ PMC)" of "FANUC AC SPINDLE MOTOR αi series PARAMETER MANUAL" (B-65280EN) for explanations about each signal.

(a) Spindle control signal 1 (SPCT1)

4.3.8.5 Example of observing data

The following figure shows an example of data (synchronization error and motor speed at rigid tapping) observed using the SERVO GUIDE.

*1 The synchronization error is servo axis output data.

II. TROUBLESHOOTING

1 OVERVIEW

This part describes the troubleshooting procedure for each amplifier. Read the section related to your current trouble to locate it and take an appropriate action.

First, check the alarm number and STATUS display indicated on your amplifier with each list (alarm numbers in the list are those for the CNC) in Chapter 2 to find the corresponding detailed information in Chapter 3. Then take an appropriate action according to the detailed information.

2 ALARM NUMBERS AND BRIEF DESCRIPTIONS

3

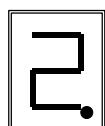

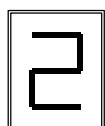

TROUBLESHOOTING AND ACTION

3.1 POWER SUPPLY (αiPS , αiPS_R)

If an alarm occurs, in the STATUS display, the ALM LED lights red, and the one-digit 7-segment display indicates an alarm code or warning code.

The meaning of each warning code is the same as that of the corresponding alarm code. If a warning code is displayed, an alarm condition will occur in a certain period of time. The Power Supply remains operable while the warning code stays displayed.

Example of an alarm
code display Example of a warning
code display

3.1.1 No LED Display (αiPS , αiPS_R)

(1) Meaning

The 200-V control power (CX1A) is not supplied.
Alternatively, the 24-VDC power is short-circuited.

(2) Cause and troubleshooting

- (a) Check whether the circuit breaker for the control power supply is off.
When a lightning surge absorber is connected immediately following the circuit breaker, check whether the lightning surge absorber is short-circuited by lightning. If the lightning surge absorber is short-circuited, replace it.
- (b) Disconnect the cable from the connector CX1A and turn the control power on. If "-" is displayed, the 24-V power to a Servo Amplifier or Spindle Amplifier may be short-circuited.
 - Detect the amplifier which causes the power to be short-circuited by sequentially connecting the cable from the Power Supply and replace it.
- (c) Disconnect the cable from the connector CX4 and turn the control power on. If "-" is displayed, the external 24-V power may be connected to pin 3 of CX4 incorrectly.
 - Correct the connection.

3.1.2 Alarm Code 1 (αiPS)

For the αiPS -5.5 to -15 and 11HV to 18HV

(1) Meaning

The main circuit power module (IPM) has detected an abnormal condition.

(2) Cause and troubleshooting

- (a) Control supply voltage decrease of the power module (IPM)
 - Replace the power unit.
- (b) Input supply voltage imbalance
 - Check the input power supply specification.
- (c) The specification of the AC reactor does not match the PSM in use.
 - Check the PSM and the specification of the AC reactor.

- (d) IPM failure
 → Replace the IPM.

For the $\alpha iPS15$ to -55 and $30HV$ to $100HV$

- (1) Meaning
 Overcurrent flowed into the input of the main circuit.

- (2) Cause and troubleshooting
 (a) Input supply voltage imbalance
 → Check the input power supply specification.
 (b) The specification of the AC reactor does not match the PSM in use.
 → Check the PSM and the specification of the AC reactor.
 (c) IGBT defective
 → Replace IGBT.

3.1.3 Alarm Code 2 (αiPS , αiPS_R)

- (1) Meaning
 A cooling fan for the control circuit has stopped.
 With the A06B-6140-HXXX or A06B-6150-HXXX (an upgrade version of PS), this alarm is also issued when a unit stirring fan has stopped.
- (2) Cause and troubleshooting
 (a) Cooling fan broken
 Check whether the cooling fan rotates normally.
 → Replace it.
 (b) Internal stirring fan broken (only with an upgrade version of PS)
 → Replace it.

3.1.4 Alarm Code 3 (αiPS)

- (1) Meaning
 The temperature of the main circuit heat sink has risen abnormally.
- (2) Cause and troubleshooting
 (a) Cooling fan for the main circuit broken
 Check whether the cooling fan for the main circuit rotates normally.
 → Replace it.
 (b) Dust accumulation
 → Clean the cooling system with a vacuum cleaner or the factory air blower.
 (c) Overload
 → Examine the operating conditions.
 (d) Poor installation of the control printed-circuit board
 → Be sure to push the faceplate as far as it will go. (This alarm may be displayed if one of the connectors for connection between the control printed-circuit board and power printed-circuit board is detached.)

3.1.5 Alarm Code 4 (αiPS , αiPS_R)

- (1) Meaning
 In the main circuit, the DC voltage (DC link) has dropped.
- (2) Cause and troubleshooting
 (a) A small power dip has occurred.
 → Check the power supply.

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

- (b) Low input power supply voltage
 - Check the power supply specification.
- (c) The main circuit power supply may have been switched off with an emergency stop state released.
 - Check the sequence.

3.1.6 Alarm Code 5 (αiPS , αiPS_R)

(1) Meaning

The main circuit capacitor was not recharged within the specified time.

(2) Cause and troubleshooting

- (a) Too many Servo Amplifier and/or Spindle Amplifier units are connected.
 - Check the specification of the PSM.
- (b) The DC link is short-circuited.
 - Check the connection.
- (c) The recharge current limiting resistor is defective.
 - Replace the distributing board.

3.1.7 Alarm Code 6 (αiPS , αiPS_R)

(1) Meaning

The control power supply voltage decrease.

The 24-V power supply is abnormal in the Power Supply. (Internal fuse blown)

(2) Cause and troubleshooting

- (a) Input voltage decrease
 - Check the power supply.
- (b) Power Supply broken
 - If this alarm is issued just by turning the control power on, replace the Power Supply.

3.1.8 Alarm Code 7 (αiPS , αiPS_R)

(1) Meaning

In the main circuit, the DC voltage at the DC link is abnormally high.

(2) Cause and troubleshooting

- (a) Excessive regenerated power
 - The PSM does not have a sufficient capacity.
 - Check the specification of the PSM.
- (b) The output impedance of the AC power source is too high.
 - Check the power source output impedance.
 - (Normal if the voltage variation at maximum output time is within 7%)
- (c) The main circuit power supply may have been switched off with an emergency stop state released.
 - Check the sequence.

3.1.9 Alarm Code 8 (αiPS_R)

(1) Meaning

There is excessive short-term regenerative power.

(2) Cause and troubleshooting

- (a) Insufficient regenerative resistance
 - Review the specification of the regenerative resistance.

- (b) Regenerative circuit failure
 → The regenerative circuit is abnormal. Replace the PSMR.

3.1.10 Alarm Code A (αiPS)

(1) Meaning

A cooling fan of external cooling fin has stopped.

With the A06B-6110-HXXX or A06B-6120-HXXX, this alarm is also issued when a unit stirring fan has stopped.

(2) Cause and troubleshooting

- (a) Cooling fan for the radiator cooling fin broken
 Check whether the cooling fan for the radiator cooling fin rotates normally.
 → Replace it.
- (b) Unit stirring fan broken (A06B-6110-HXXX,A06B-6120-HXXX のみ)
 Check whether the unit stirring fan rotates normally.
 → Replace it.
- (c) Poor installation of the control printed-circuit board
 → Be sure to install the control printed-circuit board.
 (This alarm may be issued if one of the connectors for connection between the control printed-circuit board and power printed-circuit board become loose.)
- (d) Poor installation of the control printed-circuit board
 → Be sure to push the faceplate as far as it will go. (This alarm may be displayed if one of the connectors for connection between the control printed-circuit board and power printed-circuit board is detached.)

3.1.11 Alarm Code E (αiPS , αiPS_R)

(1) Meaning

The input power supply is abnormal (open phase).

(2) Cause and troubleshooting

- (a) The input power supply has an open phase.
 Check the power supply voltage.
 → If there is no problem with the power supply voltage, check the connections.

3.1.12 Alarm Code H (αiPS_R)

(1) Meaning

The temperature of the regenerative resistor has arisen abnormally.

(2) Cause and troubleshooting

- (a) Regenerative resistance not detected
 → Check the wiring for the regenerative resistance.
- (b) Insufficient regenerative resistance
 → Review the specification for the regenerative resistance.
- (c) Excessive regenerative power
 → Reduce the frequency at which acceleration/ deceleration occurs.
- (d) Regenerative resistor cooling fan stopped
 → Check to see if the regenerative resistor cooling fan has stopped.

3.1.13 Alarm Code P (αiPS , αiPS_R)

(1) Meaning

Communication error between amplifiers

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

- (2) Cause and troubleshooting
 - (a) Check the connector and cable (CXA2A).
 - (b) Replace the Power Supply (control printed-circuit board).

3.2 SERVO AMPLIFIER

The following table lists alarms related to the Servo Amplifier.

See this table while comparing the CNC alarm codes presented in Chapter 2, "Alarm Numbers and Brief Description" with the LED displays of the Servo Amplifier.

Alarm	LED display	Major cause	Reference
Inverter: internal cooling fan stopped	1	- Fan not running. - Fan motor connector or cable defective - Servo Amplifier failure	3.2.1
Inverter: control power supply undervoltage	2	- The 24 V control power supply output from the Power Supply is low. - Connector/cable (CXA2A/B) defective - Servo Amplifier failure	3.2.2
Inverter: DC link undervoltage	5	- Low input voltage - DC link short-bar poor connection - Servo Amplifier failure	3.2.3
Inverter: overheat	6	- The motor is being used under a harsh condition. - The ambient temperature is high. - Servo Amplifier failure	3.2.4
Inverter: cooling fan stopped of the radiator	F	- Fan not running. - Fan motor connector or cable defective - Servo Amplifier failure	3.2.5
Communication error between amplifiers	P	- Connector/cable (CXA2A/B) defective - Servo Amplifier failure	3.2.6
Inverter: DC link current alarm (L axis)	8	- Short-circuit between power lead phases or ground fault in them - Short-circuit between motor winding phases or ground fault in them - Servo Amplifier failure	3.2.7
Inverter: IPM alarm (L axis)	8.	- Short-circuit between power lead phases or ground fault in them	3.2.8
Inverter: IPM alarm (M axis)	9.	- Short-circuit between motor winding phases or ground fault in them	
Inverter: IPM alarm (N axis)	A.	- Servo Amplifier failure	
Inverter: IPM alarm (OH) (L axis)	8.	- The motor is being used under a harsh condition.	3.2.9
Inverter: IPM alarm (OH) (M axis)	9.	- The ambient temperature is high.	
Inverter: IPM alarm (OH) (N axis)	A.	- Servo Amplifier failure	
Inverter: motor current alarm (L axis)	b	- Short-circuit between power lead phases or ground fault in them	3.2.10
Inverter: motor current alarm (M axis)	c	- Short-circuit between motor winding phases or ground fault in them	
Inverter: motor current alarm (N axis)	d	- Incorrect motor ID setting - Servo Amplifier failure - Motor failure	
Inverter: abnormal control power supply	Blinking -	- Connector or cable (JF*) failure - Motor failure - Servo Amplifier failure	3.2.11
Inverter: FSSB communication error (COP10B)	U	- Connector or cable (COP10B) failure - Servo Amplifier failure - CNC failure	3.2.12

Alarm	LED display	Major cause	Reference
Inverter: FSSB communication error (COP10A)	L	- Connector or cable (COP10A) failure - Servo Amplifier failure	3.2.13

3.2.1 Alarm Code 1

(1) Meaning

Inverter: internal cooling fan stopped

(2) Cause and troubleshooting

- (a) Check whether there is any foreign material in the fan.
- (b) Be sure to push the faceplate (control printed-circuit board) as far as it will go.
- (c) Check that the fan connector is attached correctly.
- (d) Replace the fan.
- (e) Replace the Servo Amplifier.

3.2.2 Alarm Code 2

(1) Meaning

Inverter: control power supply undervoltage

(2) Cause and troubleshooting

- (a) Check the three-phase input voltage of the amplifier (the voltage shall not be lower than 85% of the rated input voltage).
- (b) Check the 24 V power supply voltage output from the Power Supply (the voltage shall normally not lower than 22.8 V).
- (c) Check the connector and cable (CXA2A/B).
- (d) Replace the Servo Amplifier.

3.2.3 Alarm Code 5

(1) Meaning

Inverter: DC link undervoltage

(2) Cause and troubleshooting

- (a) Check that the screws for the DC link connection cable (bar) are tight.
- (b) If a DC link low voltage alarm condition occurs in more than one module, see Subsection 3.1.4, "Alarm code 4" for explanations about how to troubleshoot the Power Supply.
- (c) If a DC link low voltage alarm condition occurs in one Servo Amplifier only, be sure to push the faceplate (control printed-circuit board) of that Servo Amplifier as far as it will go.
- (d) Replace the Servo Amplifier in which this alarm has occurred.

3.2.4 Alarm Code 6

(1) Meaning

Inverter: overheat

(2) Cause and troubleshooting

- (a) Check that the motor is being used at or below its continuous rating.
- (b) Check that the cooling capacity of the cabinet is sufficient (inspect the fans and filters).
- (c) Check that the ambient temperature is not too high.
- (d) Be sure to push the faceplate (control printed-circuit board) as far as it will go.
- (e) Replace the Servo Amplifier.

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

3.2.5 Alarm Code F

(1) Meaning

Inverter: cooling fan stopped of the radiator

(2) Cause and troubleshooting

- (a) Check whether there is any foreign material in the fan.
- (b) Be sure to push the faceplate (control printed-circuit board) as far as it will go.
- (c) Check that the fan connector is attached correctly.
- (d) Replace the fan.
- (e) Replace the Servo Amplifier.

3.2.6 Alarm Code P

(1) Meaning

Communication error between amplifiers

(2) Cause and troubleshooting

- (a) Check the connector and cable (CXA2A/B).
- (b) Replace the control printed-circuit board.
- (c) Replace the Servo Amplifier.

3.2.7 Alarm Code 8

(1) Meaning

Inverter: DC link current alarm

(2) Cause and troubleshooting

- (a) Disconnect the motor power leads from the Servo Amplifier, and release the Servo Amplifier from an emergency stop condition.
 - <1> If no abnormal DC link current alarm condition has occurred → Go to (b).
 - <2> If an abnormal DC link current alarm condition has occurred → Replace the Servo Amplifier.
- (b) Disconnect the motor power leads from the Servo Amplifier, and check the insulation between PE and the motor power lead U, V, or W.
 - <1> If the insulation is deteriorated → Go to (c).
 - <2> If the insulation is normal → Replace the Servo Amplifier.
- (c) Disconnect the motor from its power leads, and check whether the insulation of the motor or power leads is deteriorated.
 - <1> If the insulation of the motor is deteriorated → Replace the motor.
 - <2> If the insulation of any power lead is deteriorated → Replace the power lead.

3.2.8 Alarm Codes 8., 9., and A.

(1) Meaning

Inverter: IPM alarm

(2) Cause and troubleshooting

- (a) Be sure to push the faceplate (control printed-circuit board) as far as it will go.
- (b) Disconnect the motor power leads from the Servo Amplifier, and release the Servo Amplifier from an emergency stop condition.
 - <1> If no IPM alarm condition has occurred → Go to (b).
 - <2> If an IPM alarm condition has occurred → Replace the Servo Amplifier.
- (c) Disconnect the motor power leads from the Servo Amplifier, and check the insulation between PE and the motor power lead U, V, or W.
 - <1> If the insulation is deteriorated → Go to (c).
 - <2> If the insulation is normal → Replace the Servo Amplifier.

- (d) Disconnect the motor from its power leads, and check whether the insulation of the motor or power leads is deteriorated.
- <1> If the insulation of the motor is deteriorated → Replace the motor.
 <2> If the insulation of any power lead is deteriorated → Replace the power lead.

3.2.9 Alarm Codes 8., 9., and A.

(1) Meaning

Inverter: IPM alarm (OH)

(2) Cause and troubleshooting

- (a) Be sure to push the faceplate (control printed-circuit board) as far as it will go.
- (b) Check that the heat sink cooling fan is running.
- (c) Check that the motor is being used at or below its continuous rating.
- (d) Check that the cooling capacity of the cabinet is sufficient (inspect the fans and filters).
- (e) Check that the ambient temperature is not too high.
- (f) Replace the Servo Amplifier.

3.2.10 Alarm Codes b, c, and d

(1) Meaning

Inverter: DC link current alarm

(2) Cause and troubleshooting

(a) Checking the servo parameters

Referring to "FANUC AC SERVO MOTOR αi series Parameter Manual (B-65270EN)," check whether the following parameters have default values.

Series 15i	No.1809	No.1852	No.1853
Series 16i, 18i, 20i, 21i, 0i Power Mate i	No.2004	No.2040	No.2041

Alternatively, if an abnormal motor current alarm condition occurs only on rapid acceleration/deceleration, it is likely that the motor is being used under too harsh a condition. Increase the acceleration/deceleration time constant, and see what will occur.

- (b) Be sure to push the faceplate (control printed-circuit board) as far as it will go.
- (c) Disconnect the motor power leads from the Servo Amplifier, and release the Servo Amplifier from an emergency stop condition.

 - <1> If no abnormal motor current occurs → Go to (c).
 <2> If an abnormal motor current occurs → Replace the Servo Amplifier.

- (d) Disconnect the motor power leads from the Servo Amplifier, and check the insulation between PE and the motor power lead U, V, or W.

 - <1> If the insulation is deteriorated → Go to (d).
 <2> If the insulation is normal → Replace the Servo Amplifier.

- (e) Disconnect the motor from its power leads, and check whether the insulation of the motor or power leads is deteriorated.

 - <1> If the insulation of the motor is deteriorated → Replace the motor.
 <2> If the insulation of any power lead is deteriorated → Replace the power lead.

3.2.11 Alarm Code "-" Blinking

(1) Meaning

Inverter: abnormal control power supply

(2) Cause and troubleshooting

- (a) Disconnect the feedback cable (JF*) from the Servo Amplifier, and then switch on the power.

 - <1> If blinking continues → Replace the Servo Amplifier.
 <2> If blinking stops → Go to (b).

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

- (b) Disconnect the feedback cable (JF*) from the Pulsecoder, and then switch on the power. (Keep the cable on the Servo Amplifier side connected.)
<1> If blinking continues → Replace the cable.
<2> If blinking stops → Replace the motor.

3.2.12 Alarm Code U

(1) Meaning

Inverter: FSSB communication error (COP10B) (NOTE)

(2) Cause and troubleshooting

- (a) Replace the Servo Amplifier optical cable (COP10B) that is nearest to the CNC on which "U" is displayed (in Fig. 3.2.12, the cable between UNIT2 and UNIT3).
(b) Replace the Servo Amplifier that is nearest to the CNC on which "U" is displayed (in Fig. 3.2.12, UNIT3).
(c) Replace the COP10B-side Servo Amplifier that is nearest to the CNC on which "U" is displayed (in Fig. 3.2.12, UNIT2).
(d) Replace the servo card in the CNC.

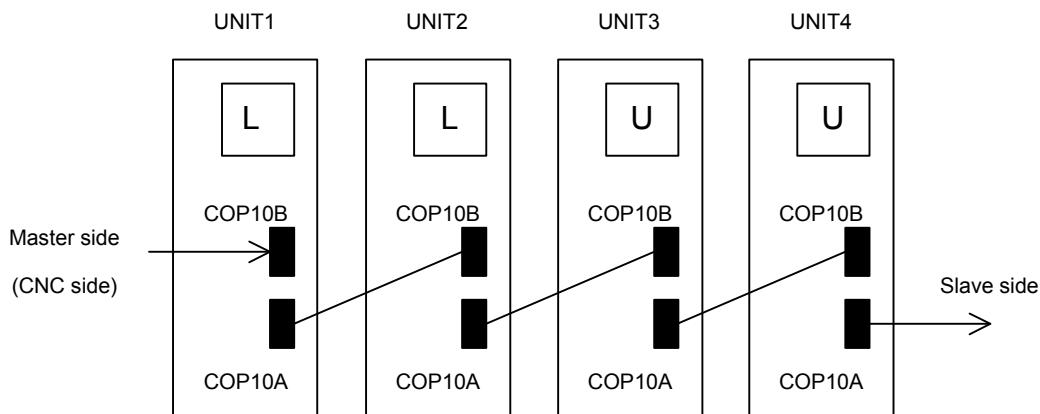

Fig. 3.2.12

NOTE

When the CNC power is turned on, "U" blinks momentarily, and then "-" steadily lights. This is not a failure, though.

3.2.13 Alarm Code L

(1) Meaning

Inverter: FSSB communication error (COP10A)

(2) Cause and troubleshooting

- (a) Replace the Servo Amplifier optical cable (COP10A) that is farthest to the CNC on which "L" is displayed (in Fig. 3.2.13, the cable between UNIT2 and UNIT3).
(b) Replace the Servo Amplifier that is farthest to the CNC on which "L" is displayed (in Fig. 3.2.13, UNIT2).
(c) Replace the COP10A-side Servo Amplifier that is farthest to the CNC on which "L" is displayed (in Fig. 3.2.13, UNIT3).

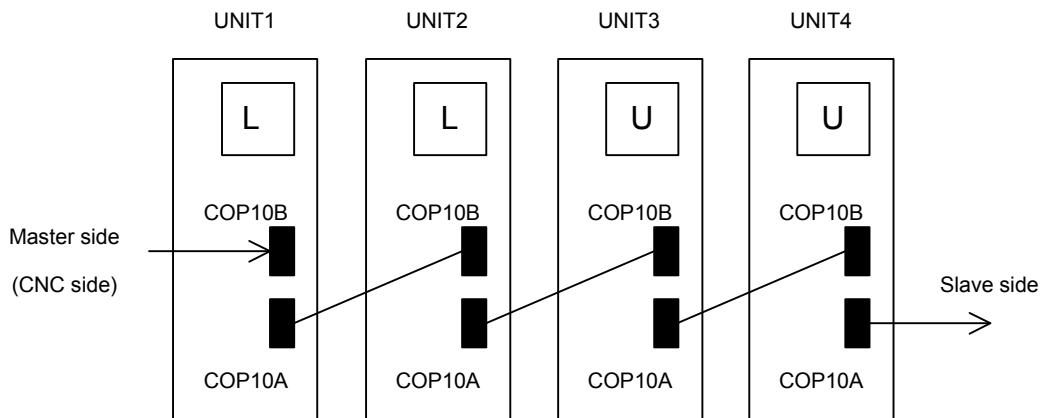

Fig. 3.2.13

3.2.14 DB Relay Error (CNC Message "Alarm SV0654")

- (1) Meaning
DB relay error
- (2) Cause and troubleshooting
 - (a) Check whether the power lead is short-circuited.
 - (b) Replace the Servo Amplifier.

3.3 SERVO SOFTWARE

If a servo alarm is issued, an alarm message is output, and details of the alarm are also displayed on the servo adjustment screen or the diagnosis screen. Using the alarm identification table given in this section, determine the alarm, and take a proper action.

3.3.1 Servo Adjustment Screen

The following procedure can be used to display the servo adjustment screen.
(The DPL/MDI of the Power Mate has no servo adjustment screen.)

- **Series 15i**

→ [CHAPTER] → [SERVO] → [▷] → [SERVO ALARM]

- **Series 16i, 18i, 20i, 21i, 0i**

→ [SYSTEM] → [▷] → [SV-PRM] → [SV-TUN]

If the servo setting screen does not appear, specify the following parameter, then switch the CNC off and on again.

#7	#6	#5	#4	#3	#2	#1	#0
3111							SVS

SVS (#0)=1 (to display the servo setting screen)

3.3.3 Overload Alarm (Soft Thermal, OVC)

(Alarm identification method)

	#7	#6	#5	#4	#3	#2	#1	#0
<1> Alarm 1	OVL	LVA	OVC	HCA	HVA	DCA	FBA	OFA

(Action)

- (1) Make sure that the motor is not vibrating.
⇒ If a motor vibrates, the current flowing in it becomes more than necessary, resulting in an alarm.
- (2) Make sure that the power lead to the motor is connected correctly.
⇒ If the connection is incorrect, an abnormal current flows in the motor, resulting in an alarm.
- (3) Make sure that the following parameters are set correctly.
⇒ An overload alarm is issued based on the result of calculation of these parameters. Be sure to set them to the standard values. For details of the standard values, refer to the FANUC AC SERVO MOTOR *ai* series Parameter Manual (B-65270EN).

No. 1877 (FS15 <i>i</i>)	Overload protection coefficient (OVC1)
No. 2062 (FS16 <i>i</i>)	
No. 1878 (FS15 <i>i</i>)	Overload protection coefficient (OVC2)
No. 2063 (FS16 <i>i</i>)	
No. 1893 (FS15 <i>i</i>)	Overload protection coefficient (OVCLMT)
No. 2065 (FS16 <i>i</i>)	
No. 1785 (FS15 <i>i</i>)	Overload protection coefficient (OVC21)
No. 2162 (FS16 <i>i</i>)	

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

No. 1786 (FS15 <i>i</i>)	Overload protection coefficient (OVC22)
No. 2163 (FS16 <i>i</i>)	
No. 1787 (FS15 <i>i</i>)	Overload protection coefficient (OVCLMT2)
No. 2165 (FS16 <i>i</i>)	

Measure the actual current values (IR, IS) using the SERVO GUIDE, compare the values with overload duty curves in the Servo Motor Descriptions (B-65262EN), and check whether the load on the machine is too large compared with the motor capacity. If the actual current is high on acceleration/deceleration, it is likely that the time constant is too small.

3.3.4 Feedback Disconnected Alarm

(Alarm identification method)

	#7	#6	#5	#4	#3	#2	#1	#0
<1> Alarm 1	OVL	LVA	OVC	HCA	HVA	DCA	FBA	OFA
<2> Alarm 2	ALD			EXP				
<6> Alarm 6					SFA			

FBA	ALD	EXP	SFA	Alarm description	Action
1	1	1	0	Hard disconnection (separate phase A/B)	1
1	0	0	0	Soft disconnection (closed loop)	2
1	0	0	1	Soft disconnection (α Pulsecoder)	3

(Action)

Action 1: This alarm is issued when a separate phase A/B scale is used. Check if the phase A/B detector is connected correctly.

Action 2: This alarm is issued when the position feedback pulse variation is small relative to the velocity feedback pulse variation. This means that this alarm is not issued when a semi-full is used. Check if the separate detector outputs position feedback pulses correctly. If position feedback pulses are output correctly, it is considered that the motor alone is rotating in the reverse direction at the start of machine operation because of a large backlash between the motor position and scale position.

	#7	#6	#5	#4	#3	#2	#1	#0
No. 1808 (FS15 <i>i</i>)							TGAL	
No. 2003 (FS16 <i>i</i>)								

TGAL (#1) 1: Uses the parameter for the soft disconnection alarm detection level.

No. 1892 (FS15 <i>i</i>)	Soft disconnection alarm level
No. 2064 (FS16 <i>i</i>)	

Standard setting 4: Alarm issued for a 1/8 rotation of the motor.
Increase this value.

Action 3: This alarm is issued when synchronization between the absolute position data sent from the built-in Pulsecoder and phase data is lost. Turn off the power to the CNC, then detach the Pulsecoder cable then attach it again. If this alarm is still issued, replace the Pulsecoder.

3.3.5 Overheat Alarm

(Alarm identification method)

	#7	#6	#5	#4	#3	#2	#1	#0
<1> Alarm 1	OVL	LVA	OVC	HCA	HVA	DCA	FBA	OFA
<2> Alarm 2	ALD			EXP				

OVL	ALD	EXP	Alarm description	Action
1	1	0	Motor overheat	1
1	0	0	Amplifier overheat	1

(Action)

(1) Motor overheat

First, check whether the motor temperature is high immediately after the alarm is issued. If the alarm is issued when the motor temperature is not high, the temperature detection circuit may be abnormal. Contact your FANUC service staff.

When the motor temperature is high immediately after the alarm is issued, check the following items:

(a) Check the cooling state of the motor.

<1> If the cooling state is abnormal, for example, when the cooling fan stops, check the power specification (voltage, phase sequence, and so on) of the cooling fan. If there is no problem with the power specification, replace the fan unit.

<2> When a liquid-cooled motor is used, check the cooling system.

<3> When the motor ambient temperature is higher than the specified temperature, lower the ambient temperature to satisfy the specification.

(b) Increase the time constant or stop time in the program to ease the cutting conditions.

Motor temperature information is displayed on the diagnosis screen.

Motor temperature: Diagnosis information No. 308 (Series 16i, 30i, and others), diagnosis information No. 3520 (Series 15i)

Pulsecoder temperature: Diagnosis information No. 309 (Series 16i, 30i, and others), diagnosis information No. 3521 (Series 15i)

If an overheat alarm is issued when the temperature is not high, contact your FANUC service staff.

(2) Amplifier overheat

See the description about inverter overheat in Subsection 3.2.4.

3.3.6 Invalid Servo Parameter Setting Alarm

The invalid servo parameter setting alarm is issued when a setting out of the specifiable range is specified, or an overflow has occurred in an internal calculation. When an invalid parameter is detected on the servo side, alarm 4 #4 (PRM) = 1 results.

(Alarm identification method)

	#7	#6	#5	#4	#3	#2	#1	#0
<4> Alarm 4	DTE	CRC	STB	PRM				

For details and action required when the invalid servo parameter setting alarm is issued on the servo side, refer to the FANUC AC SERVO MOTOR *ai* series Parameter Manual (B-65270EN).

(Reference information)

Method of checking details of an invalid parameter detected on the servo side

(For Series 15i)

A number is indicated in the item "Details of invalid parameter" on the servo alarm screen (Fig. 3.3.1(b)).

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

(For Series 16*i*, 18*i*, 21*i*, 0*i*, and Power Mate *i*)

A number is indicated in No. 352 of the diagnosis screen.

Referring to "FANUC AC SERVO MOTOR *ai* series Parameter Manual (B-65270EN)" for details.

3.3.7 Alarms Related to PulseCoder and Separate Serial Detector

(Bits for alarm identification)

	#7	#6	#5	#4	#3	#2	#1	#0
<1> Alarm 1	OVL	LVA	OVC	HCA	HVA	DCA	FBA	OFA
<2> Alarm 2	ALD			EXP				
<3> Alarm 3		CSA	BLA	PHA	RCA	BZA	CKA	SPH
<4> Alarm 4	DTE	CRC	STB	PRM				
<5> Alarm 5		OFS	MCC	LDM	PMS	FAN	DAL	ABF
<6> Alarm 6					SFA			
<7> Alarm 7	OHA	LDA	BLA	PHA	CMA	BZA	PMA	SPH
<8> Alarm 8	DTE	CRC	STB	SPD				
<9> Alarm 9		FSD			SVE	IDW	NCE	IFE

- (1) For a built-in PulseCoder

An alarm is determined from the bits of alarms 1, 2, 3, and 5. The table below indicates the meaning of each bit.

Alarm 3							Alarm 5		1	Alarm 2		Alarm description	Action
CSA	BLA	PHA	RCA	BZA	CKA	SPH	LDM	PMA	FBA	ALD	EXP		
						1						Soft phase alarm	2
				1								Zero battery voltage	1
			1						1	1	0	Count error alarm	2
		1										Phase alarm	2
	1											Battery voltage decrease (warning)	1
							1					Pulse error alarm	
							1					LED error alarm	

⚠ CAUTION

An alarm for which no action number is given is considered to be caused by a PulseCoder failure. Replace the PulseCoder.

- (2) For a separate serial detector

An alarm is determined from the bits of alarm 7. The table below indicates the meaning of each bit.

Alarm 7								Alarm description		Action	
OHA	LDA	BLA	PHA	CMA	BZA	PMA	SPH				
							1			Soft phase alarm	2
						1				Pulse error alarm	
					1					Zero battery voltage	1
					1					Count error alarm	2
			1							Phase alarm	2
		1								Battery voltage decrease (warning)	1
	1									LED error alarm	
1										Separate detector alarm	3

3.TROUBLESHOOTING AND

B-65285EN/04

TROUBLESHOOTING

ACTION

⚠ CAUTION

An alarm for which no action number is given is considered to be caused by a detector failure. Replace the detector.

(Action)

Action 1: Battery-related alarms

Check if a battery is connected. When the power is turned on for the first time after a battery is connected, the zero battery voltage alarm is issued. In such a case, turn off the power, then turn on the power again. If the alarm is still issued, check the battery voltage. If the battery voltage decrease alarm is issued, check the voltage, and replace the battery as required.

Action 2: Alarms that may be issued for noise

If an alarm is issued intermittently or after emergency stop cancellation, noise is probably the cause. So, provide noise protection. If the same alarm is still issued after noise protection is provided, replace the detector.

Action 3: Alarm condition detected by the separate detector

If the separate detector detects an alarm condition, contact the manufacturer of the detector for information on troubleshooting.

(3) Alarms related to serial communication

An alarm is determined from the bits of alarms 4 and 8.

Alarm 4			Alarm 8			Alarm description
DTE	CRC	STB	DTE	CRC	STB	
1						Serial Pulsecoder communication alarm
	1					
		1				
			1			Separate serial Pulsecoder communication alarm
				1		
					1	

Action: Serial communication is not performed correctly. Check if the cable is connected correctly and is not broken. If CRC or STB is issued, noise may be the cause. So, provide noise protection. If CRC or STB is always issued after the power is turned on, the Pulsecoder or amplifier control board or the pulse module may be faulty.

3.3.8 Other Alarms

(Alarm identification method)

#7	#6	#5	#4	#3	#2	#1	#0
<5> Alarm 5		OFS	MCC	LDM	PMS	FAN	DAL

OFS	DAL	ABF	Alarm description	Action
		1	Feedback mismatch alarm	1
	1		Excessive semi-full error alarm	2
1			Current offset error alarm	3

(Action)

Action 1: This alarm is issued when the move direction of the position detector is opposite to the move direction of the speed detector. Check the rotation direction of the separate detector. If the rotation direction of the separate detector is opposite to the rotation direction of the motor, take the following action:

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

For a phase A/B detector:

Reverse the connections of A and \bar{A} .

For a serial detector:

Reverse the setting of the signal direction of the separate detector.

In the Series 90B0/G(07) and subsequent editions, the following settings enable signal directions in the A/B phase detector to be inverted.

	#7	#6	#5	#4	#3	#2	#1	#0
No. 1960 (FS15 <i>i</i>)								RVRSE
No. 2018 (FS16 <i>i</i>)								

RVRSE (#0) Reverses the signal direction of the separate detector.

0: Does not reverse the signal direction of the separate detector.

1: Reverses the signal direction of the separate detector.

If a large distortion exists between the motor and separate detector, this alarm may be issued in the case of abrupt acceleration/deceleration. In such a case, modify the detection level.

	#7	#6	#5	#4	#3	#2	#1	#0
No. 1741 (FS15 <i>i</i>)							RNLV	
No. 2201 (FS16 <i>i</i>)								

RNLV (#1) Modifies the feedback mismatch alarm detection level.

1: Detected with 1000 min^{-1} or more

0: Detected with 600 min^{-1} or more

Action 2: This alarm is issued when the difference between the motor position and separate detector position exceeds the excessive semi-full error level. Check if the conversion efficient for dual position feedback is set correctly. If the conversion efficient is set correctly, increase the alarm level. If this alarm is still issued after the level is modified, check the connection direction of the scale.

No. 1971 (FS15 <i>i</i>)	Dual position feedback conversion coefficient (numerator)
No. 2078 (FS16 <i>i</i>)	

No. 1972 (FS15 <i>i</i>)	Dual position feedback conversion coefficient (denominator)
No. 2079 (FS16 <i>i</i>)	

$$\text{Conversion coefficient} = \frac{\left[\begin{array}{l} \text{Number of feedback pulses per motor} \\ \text{revolution (detection unit)} \end{array} \right]}{1,000,000}$$

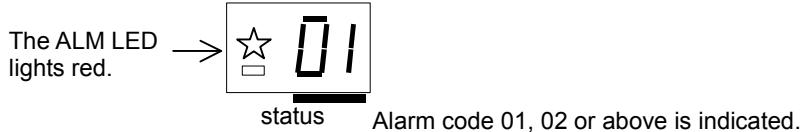

No. 1729 (FS15 <i>i</i>)	Dual position feedback semi-full error level
No. 2118 (FS16 <i>i</i>)	

[Setting] Detection unit. When 0 is set, no detection is made.

Action 3: The current offset value of the current detector (equivalent to the current value in the emergency stop state) is abnormally high. If this alarm is still issued after the power is turned off then back on, the current detector is faulty. For the *ai* series, replace the amplifier.

3.4 SPINDLE AMPLIFIER

If an alarm occurs in the Spindle Amplifier, the ALM LED lights red in the STATUS display, and the two-digit 7-segment LEDs indicate the alarm code.

3.4.1 Alarm Code 01

The inside temperature of the motor is higher than the specified temperature.

- (1) If this alarm is issued during cutting (the motor temperature is high)
 - (a) Check the cooling state of the motor.
 - <1> If the cooling fan of the spindle motor is stopped, check the power supply of the cooling fan.
If the cooling fan is still inoperative, replace it with a new one.
 - <2> When a liquid-cooled motor is used, check the cooling system.
 - <3> When the ambient temperature of the spindle motor is higher than the specified temperature, lower the ambient temperature to satisfy the specification.
 - (b) Recheck the cutting conditions.
- (2) If this alarm is issued under a light load (the motor temperature is high)
 - (a) When the frequency of acceleration/deceleration is too high
Set such a use condition that the average including output at acceleration/deceleration does not exceed the continuous rating.
 - (b) The parameters specific to the motor are not correctly set.
Referring to "FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN)," check the motor-specific parameters.
- (3) If this alarm is issued when the motor temperature is low
 - (a) The spindle motor feedback cable is faulty.
Replace the cable.
 - (b) The parameters specific to the motor are not set correctly.
Referring to "FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN)," check the motor-specific parameters.

FS15 <i>i</i>	FS16 <i>i</i> FS0 <i>i</i> -B/C	FS30 <i>i</i> FS0 <i>i</i> -D	For α series motor	For αi series motor
3134	4134	4134	0	Motor-specific parameter

- (c) The control printed circuit board is faulty.
Replace the control printed circuit board or spindle amplifier.
- (d) The motor (internal thermostat) is faulty.
Replace the motor.

3.4.2 Alarm Code 02

The actual motor speed is largely deviated from the commanded speed.

- (1) If this alarm is issued during motor acceleration
 - (a) The parameter setting of acceleration/deceleration time is incorrect.
Set the following parameter with the actual acceleration/deceleration time for your machine plus some margin.

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

FS15<i>i</i>	FS16<i>i</i> FS0<i>i</i>-B/C	FS30<i>i</i> FS0<i>i</i>-D	Description
3082	4082	4082	Setting of acceleration/deceleration time

- (b) The parameter for the speed detector is not set correctly.

Referring to "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)," set a correct value.

- (2) If this alarm is issued at a heavy cutting load

- (a) The cutting load has exceeded the motor output power.

Check the load meter indication, and review the use condition.

- (b) The parameters for output restriction are not set correctly.

Check that the settings of the following parameters satisfy the machine and motor specifications:

FS15<i>i</i>	FS16<i>i</i> FS0<i>i</i>-B/C	FS30<i>i</i> FS0<i>i</i>-D	Description
3028	4028	4028	Output restriction pattern setting
3029	4029	4029	Output restriction value

- (c) The parameters specific to the motor are not correctly.

Referring to "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)," check the motor-specific parameters.

3.4.3 Alarm Code 03

The fuse of the DC link has blown. (The voltage at the DC link is insufficient.) This alarm is checked when emergency stop is cancelled.

- (1) If this alarm is issued during spindle operation (rotation)

The fuse of the DC link inside the Spindle Amplifier has probably blown. So, replace the Spindle Amplifier. This alarm may be caused by the following:

- <1> Power lead short-circuited to ground
- <2> Motor winding short-circuited to ground
- <3> IGBT or IPM module failure

- (2) If the Power Supply input magnetic contactor is once turned on and is turned off with this alarm when emergency stop is cancelled or the CNC is started (When two spindles are connected, the magnetic contactor may not be turned off.)

- (a) The DC link wire is not connected.

Check the DC link wiring for errors.

- (b) The fuse of the DC link inside the Spindle Amplifier has blown.

Replace the Spindle Amplifier.

3.4.4 Alarm Code 06

The temperature sensor is abnormal, or the temperature sensor cable is broken.

- (1) The parameters specific to the motor are not correctly.

Referring to "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)," check the motor-specific parameters.

- (2) Cable is faulty.

Feedback cable is faulty.

Replace the cable.

- (3) The control printed-circuit board is faulty.

Replace the control printed-circuit board or spindle amplifier.

- (4) A thermo sensor is faulty.

Replace the motor (thermo sensor).

3.4.5 Alarm Code 07

The motor rotates at a speed exceeding 115% (standard setting) of the maximum allowable speed.

- (1) If this alarm is issued during spindle synchronization

If one of the motors operating in spindle synchronization is deactivated (SFR or SRV) and activated again, the spindle motor may accelerate to its maximum rotation speed in order to eliminate the position error accumulated while the motor is off, resulting in this alarm being issued.

Modify the ladder in such a way that this sequence will not be used.

- (2) Spindle Amplifier is faulty.

Replace the Spindle Amplifier.

3.4.6 Alarm Code 09

The temperature of the heat sink of the Spindle Amplifier main circuit has risen abnormally. This alarm is issued for αi SP22, αi SP30HV and later. With αi SP2.2 to αi SP15 and αi SP5.5HV to αi SP15HV, however, Alarm 12 is issued for the same cause.

- (1) If this alarm is issued during cutting (the heat sink temperature is high)

(a) If this alarm is issued when the load meter reads a value below the continuous rating of the amplifier, check the cooling state of the heat sink.

<1> If the cooling fan is stopped, check the power supply (connector CX1A/B). If the cooling fan is still inoperative, replace the Spindle Amplifier with a new one.

<2> When the ambient temperature is higher than the specified temperature, lower the ambient temperature to satisfy the specification.

(b) When this alarm is issued because the load meter reads a value above the continuous rating of the amplifier, improve the use method.

(c) When the heat sink on the back of the amplifier is too dirty, clean the heat sink, for example, by blowing air. Consider the use of a structure that prevents the heat sink from being directly exposed to coolant.

- (2) If this alarm is issued under a light load (the heat sink temperature is high)

(a) When the frequency of acceleration/deceleration is too high

Set such a use condition that the average including output at acceleration/deceleration does not exceed the continuous rating.

(b) The parameters specific to the motor are not set correctly.

Referring to "FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN)," check the motor-specific parameters.

- (3) Poor installation of the control printed-circuit board

Be sure to push the faceplate as far as it will go. (This alarm may be displayed if one of the connectors for connection between the control printed-circuit board and power printed-circuit board is detached.)

- (4) If this alarm is issued when the heat sink temperature is low

Replace the Spindle Amplifier.

3.4.7 Alarm Code 10

The control power supply voltage decreases.

Troubleshooting when this alarm is issued

The control power supply, power cable, Power Supply, or Spindle Amplifier is defective.

Replace the control power supply, power cable, Power Supply, or Spindle Amplifier.

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

3.4.8 Alarm Code 12

An excessively large current flowed into the DC link of the main circuit.

With αi SP2.2 to αi SP15 and αi SP5.5HV to αi SP15HV, this alarm indicates that the power module (IPM) of the main circuit detected an error such as an excessive load, overcurrent.

- (1) If this alarm is issued on αi SP2.2 to αi SP1 and αi SP5.5HV to αi SP15HV
Check alarm code 09 as well.
- (2) Poor installation of the control printed-circuit board
Be sure to push the faceplate as far as it will go. (This alarm may be displayed if one of the connectors for connection between the control printed-circuit board and power printed-circuit board is detached.)
- (3) If this alarm is issued immediately after a spindle rotation command is specified
 - (a) The motor power lead is faulty.
Check for a short circuit between motor power leads and short-circuit to ground, and replace the power lead as required.
 - (b) The motor winding has an insulation failure.
If the motor is short-circuited to ground, replace the motor.
 - (c) The parameters specific to the motor are not set correctly.
Referring to "FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN)," check the motor-specific parameters.
 - (d) The Spindle Amplifier is faulty.
A power element (IGBT, IPM) may be destroyed. Replace the Spindle Amplifier.
- (4) If this alarm is issued during spindle rotation
 - (a) A power element is destroyed.
A power element (IGBT, IPM) may be destroyed. Replace the Spindle Amplifier.
If the amplifier setting condition is not satisfied, or cooling is insufficient because the heat sink is dirty, the power elements may be destroyed.
When the heat sink on the back of the amplifier is too dirty, clean the heat sink, for example, by blowing air. Consider the use of a structure that prevents the heat sink from being directly exposed to coolant.
For the installation condition, refer to "FANUC SERVO AMPLIFIER αi series Descriptions (B-65282EN)."
 - (b) The parameters specific to the motor are not set correctly.
Referring to "FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN)," check the parameters specific to the motor.
 - (c) Speed sensor signal error
Check the spindle sensor signal waveform. If an error is found, make an adjustment or replace the sensor as required.

3.4.9 Alarm Code 13

An error was detected in the CPU internal RAM.

Troubleshooting when this alarm is issued

The Spindle Amplifier is abnormal. Replace the Spindle Amplifier.

3.4.10 Alarm Code 14

Amplifier ID data inconsistent with series and edition of software was detected.

Troubleshooting when this alarm is issued

The Spindle Amplifier is abnormal. Replace the Spindle Amplifier.

3.4.11 Alarm Code 15

In output switching control or spindle switching control, the switching operation sequence was not executed correctly.

This alarm is issued if one second or more elapses from the transition of a switch request signal (SPSL or RSL) until a power lead state check signal (MCFN, MFNHG, RCH, or RCHHG) makes a transition.

(1) Troubleshooting when this alarm is issued

- (a) The magnetic contactor (switch unit) for power lead switching is faulty.
If the contact is inoperative, check the power supply of the magnetic contactor. If the magnetic contactor is still inoperative, replace the magnetic contactor.
- (b) The I/O unit or wiring for checking the contact of the magnetic contactor is faulty.
If a defect is found in the I/O unit or wiring, replace the I/O unit or wiring.
- (c) The sequence (ladder) is incorrect.
Modify the sequence so that switching is completed within 1 second.

3.4.12 Alarm Code 16

An error was found in a CPU internal RAM test by the Dual Check Safety function.

Troubleshooting when this alarm is issued

The Spindle Amplifier is abnormal. Replace the Spindle Amplifier.

3.4.13 Alarm Code 17

An error was detected in amplifier ID data.

Troubleshooting when this alarm is issued

The Spindle Amplifier control printed-circuit board becomes loose or the Spindle Amplifier is abnormal.

Check whether the Spindle Amplifier control printed-circuit board is mounted correctly.

When the board is mounted correctly, replace the Spindle Amplifier.

3.4.14 Alarm Code 18

A sum check is abnormal.

If this alarm is issued, replace the Spindle Amplifier or Spindle Amplifier control printed-circuit board.

3.4.15 Alarm Codes 19 and 20

The offset voltage of the phase U (alarm code 19) or phase V (alarm code 20) current detection circuit is excessively high. A check is made when the power is turned on.

If this alarm is issued, replace the Spindle Amplifier. If this alarm is issued immediately after the Spindle Amplifier control printed circuit board is replaced, check the plugging of the connectors between the power unit and Spindle Amplifier control printed circuit board.

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

3.4.16 Alarm Code 21

The specified polarity of the position sensor is incorrect.

Troubleshooting when this alarm is issued

- (a) Check the position sensor polarity parameter (bit 4 of parameter No. 4001).
- (b) Check the feedback cable of the position sensor.

3.4.17 Alarm Code 22

Overcurrent exceeding the time rating of the Spindle Amplifier flowed.

Possible causes are a high frequency of acceleration/deceleration and high cutting load.

Troubleshooting when this alarm is issued

Ease the operation conditions.

3.4.18 Alarm Code 24

Serial communication data transferred between the CNC and Spindle Amplifier contains an error. (Note)

Troubleshooting when this alarm is issued

- (a) Noise occurring between the CNC and Spindle Amplifier (connected via an electric cable) caused an error in communication data.
Check the condition for maximum wiring length.
Referring to "Connection," in "FANUC SERVO AMPLIFIER αi series Descriptions (B-65282EN)," check the condition of electric cable connection.
- (b) Noise exercises an influence because a communication cable is bundled with the power lead.
If a communication cable is bundled with the power lead for the motor, separate them from each other.
- (c) A cable is faulty.
Replace the cable.
If an optical I/O link adapter is used, the optical link adapter or optical cable may be faulty.
- (d) The Spindle Amplifier is faulty.
Replace the Spindle Amplifier or Spindle Amplifier control printed circuit board.
- (e) The CNC is faulty.
Replace the board or module related to the serial spindle.

NOTE

This alarm is issued also if the CNC power is off. This is not a failure, though.

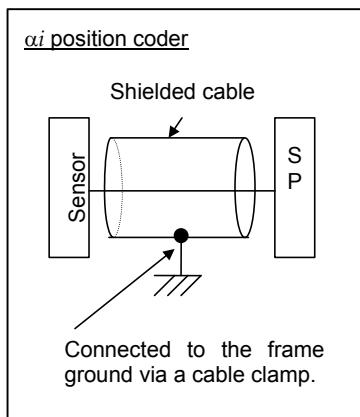

3.4.19 Alarm Code 27

The signal of the αi position coder is disconnected.

(1) If this alarm is issued when the motor is deactivated

- (a) The setting of a parameter is incorrect.
Referring to "FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN)," check the parameter for sensor setting.
- (b) The cable is disconnected.
If the connection of the feedback cable is correct, replace the cable.
- (c) The Spindle Amplifier is faulty.
Replace the Spindle Amplifier or Spindle Amplifier control printed circuit board.

- (2) If this alarm is issued when the cable is moved
- The connector has a bad contact, or the cable is disconnected.
The conductor may be broken. Replace the cable. If coolant has penetrated into the connector, clean the connector.

- (3) If this alarm is issued when the motor rotates
- The shielding of the cable between the sensor and the Spindle Amplifier is faulty.
Referring to, "Connection," in "FANUC SERVO AMPLIFIER *ai* series Descriptions (B-65282EN)," check the shielding of the cable.
 - The signal cable is bundled with the servo motor power lead.
If the cable between the sensor and the Spindle Amplifier is bundled with the servo motor power lead, separate them from each other.

3.4.20 Alarm Code 29

An excessive load (standard setting: load meter reading of 9 V) has been applied continuously for a certain period (standard setting: 30 seconds).

- If this alarm is issued during cutting
Check the load meter, and review the cutting condition.
- If this alarm is issued during a stop
 - The spindle is locked.
Check the sequence to see if the spindle is locked when a command for very slow movement is specified or orientation is specified for the spindle.
- If the spindle does not rotate as specified (the spindle rotates at a very low speed) and this alarm is issued
 - The setting of a parameter is incorrect.
Referring to "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)," check the parameter for sensor setting.
 - The phase sequence of the motor power lead is incorrect.
 - The feedback cable of the motor has a problem.
Check if the phase A/B signals are connected correctly.
 - The feedback cable of the motor is faulty.
Rotate the motor manually to see if a speed is indicated in the item of motor speed on the CNC diagnosis screen or on the spindle check board. If no speed indication is provided, replace the cable or spindle sensor (or motor).
- If the spindle does not rotate as specified (the spindle does not rotate at all) and this alarm is issued
 - The power lead is abnormal.
Check if the motor power lead is connected normally. If spindle switching or output switching is performed, check if the magnetic contactor is on.
 - The Spindle Amplifier is faulty.
Replace the Spindle Amplifier.

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

3.4.21 Alarm Code 31

The motor failed to rotate as specified, and has stopped or is rotating at a very low speed.

- (1) If the motor rotates at a very low speed and this alarm is issued

- (a) The setting of a parameter is incorrect.

Referring to "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)," check the parameter for sensor setting.

- (b) The phase sequence of the motor power lead is incorrect.

Check whether the phase sequence of the motor power lead is correct.

- (c) The feedback cable of the motor has a problem.

Check if the phase A/B signals are connected correctly.

- (d) The feedback cable of the motor is faulty.

Rotate the motor manually to see if a speed is indicated in the item of motor speed on the CNC diagnosis screen or on the spindle check board. If no speed indication is provided, replace the cable or spindle sensor (or motor).

- (2) If the motor does not rotate at all and this alarm is issued

- (a) The sequence for locking the spindle is incorrect.

Check the sequence to see if the spindle is locked.

- (b) The power lead is faulty.

Check if the power lead is connected to the motor correctly. If spindle switching or winding switching is performed, check if the magnetic contactor is on.

- (c) The Spindle Amplifier is faulty.

Replace the Spindle Amplifier.

3.4.22 Alarm Code 32

LSI memory for serial communication is abnormal. A check is made when the power is turned on.

If this alarm is issued, replace the Spindle Amplifier or Spindle Amplifier control printed circuit board.

3.4.23 Alarm Code 34

Parameter data outside the specifiable range was set.

Troubleshooting when this alarm is issued

Connect the spindle check board.

The spindle check board displays "AL-34" and "F-xxx" alternately. "F-xxx" indicates a parameter number outside the specifiable range. For the correspondence between the CNC parameter numbers and "F-xxx," refer to "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)."

3.4.24 Alarm Code 36

The error counter overflowed.

- (1) The setting of a parameter is incorrect.

- (a) The gear ratio set in a parameter is incorrect.

Check if an excessively large gear ratio is set.

- (b) The setting of a position gain is incorrect.

If the gear ratio data is correct, increase the position gain.

FS15<i>i</i>	FS16<i>i</i> FS0<i>i</i>-B/C	FS30<i>i</i> FS0<i>i</i>-D	Description
3056 to 3059	4056 to 4059	4056 to 4059	Gear ratio between the spindle and motor
3060 to 3063	4060 to 4063	4060 to 4063	Position gain at orientation
3065 to 3068	4065 to 4068	4065 to 4068	Position gain in the servo mode/spindle synchronization
3069 to 3072	4069 to 4072	4069 to 4072	Position gain in Cs contour control

(2) Sequence error

- (a) Check if the motor is deactivated (by turning off SFR/SRV) in a position control mode (rigid tapping, Cs contour control, or spindle synchronization).

3.4.25 Alarm Code 37

After emergency stop signal input, the motor is accelerated without being decelerated. This alarm is issued also when the motor is not deactivated (the motor is not decelerated completely) when the acceleration/deceleration time (initial parameter setting: 10 seconds) has elapsed after emergency stop signal input.

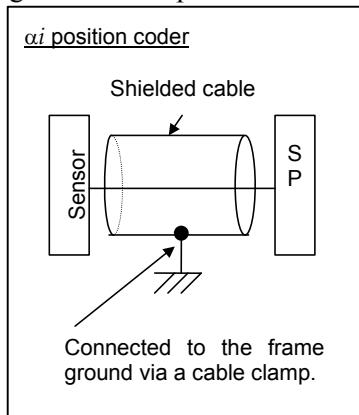

Troubleshooting when this alarm is issued

- (a) The parameter setting of the speed detector is incorrect.
Referring to Chapter 1 in "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)," set a correct time.
- (b) The parameter setting of an acceleration/deceleration time is not proper.
Check the parameter-set value and actual acceleration/ deceleration time, then set an actual acceleration/deceleration time plus some margin.

FS15<i>i</i>	FS16<i>i</i> FS0<i>i</i>-B/C	FS30<i>i</i> FS0<i>i</i>-D	Description
3082	4082	4082	Acceleration/deceleration time setting

3.4.26 Alarm Code 41

The position where the one-rotation signal of the *ai* position coder is generated is incorrect.

Troubleshooting when this alarm is issued

- (a) The setting of a parameter is incorrect.
Referring to "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)," check the parameter for sensor setting.
- (b) The *ai* position coder is faulty.
Observe the Z signal of the position coder. If the signal is not generated per rotation, replace the position coder.

3.TROUBLESHOOTING AND

ACTION	TROUBLESHOOTING	B-65285EN/04
(c)	The shielding of the cable between the sensor and Spindle Amplifier is faulty. Referring to "Connection," in "FANUC SERVO AMPLIFIER αi series Descriptions (B-65282EN)," check the shielding of the cable.	
(d)	The signal cable is bundled with the servo motor power lead. If the cable between the sensor and Spindle Amplifier is bundled with the servo motor power lead, separate them from each other.	
(e)	The Spindle Amplifier is faulty. Replace the Spindle Amplifier or Spindle Amplifier control printed circuit board.	

3.4.27 Alarm Code 42

The one-rotation signal of the αi position coder is not generated.

Troubleshooting when this alarm is issued

- (a) The setting of a parameter is incorrect.
Referring to "FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN)," check the parameter for sensor setting.
- (b) The αi position coder is faulty.
Check the check pin PSD on the spindle check board. If the signal is not generated per rotation, replace the connection cable and position coder.
- (c) The Spindle Amplifier is faulty.
Replace the Spindle Amplifier or Spindle Amplifier control printed circuit board.

3.4.28 Alarm Code 43

The position coder signal of the master spindle used in differential spindle speed control is disconnected.

For troubleshooting when this alarm is issued, see the subsection about alarm code 27.

3.4.29 Alarm Code 46

The one-rotation signal of the position coder cannot be detected normally during thread cutting.

Troubleshoot as in the case of alarm code 41.

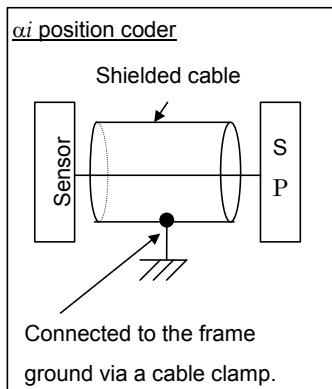

3.4.30 Alarm Code 47

The count value of αi position coder signal pulses is abnormal.

Phases A and B for the position coder have a feedback pulse count of 4096 p/rev per spindle rotation. The Spindle Amplifier checks the pulse counts of phases A and B equivalent to the position coder each time a one-rotation signal is generated. The alarm is issued when a pulse count beyond the specified range is detected.

- (1) If this alarm is issued when the cable is moved (as in the case where the spindle moves)
The conductor may be broken. Replace the cable. If coolant has penetrated into the connector, clean the connector.
- (2) Troubleshooting in other cases
 - (a) The setting of a parameter is incorrect.
Referring to "FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN)," check the parameter for sensor setting.

- (b) The shielding of the cable between the sensor and Spindle Amplifier is faulty.
Referring to "Connection," in "FANUC SERVO AMPLIFIER *ai* series Descriptions (B-65282EN)," check the shielding of the cable.
- (c) The signal cable is bundled with the servo motor power lead.
If the cable between the sensor and Spindle Amplifier is bundled with the servo motor power lead, separate them from each other.
- (d) The Spindle Amplifier is faulty.
Replace the Spindle Amplifier or Spindle Amplifier control printed circuit board.

3.4.31 Alarm Code 49

In differential spindle speed control, the speed of the master spindle converted to the motor speed of the slave spindle exceeded the allowable range.

Troubleshooting when this alarm is issued

The master spindle speed is converted to the motor speed of the slave spindle by multiplying the master spindle speed by the gear ratio between the slave spindle and motor. Check whether the converted spindle speed exceeds the maximum motor speed and operate the machine so that the maximum motor speed is not exceeded.

3.4.32 Alarm Code 50

A value obtained by internal calculation in spindle synchronization exceeded the allowable range.

Troubleshooting when this alarm is issued

- (a) The setting of parameters for gear ratio setting is incorrect.
Check if an excessively large gear ratio is set.
- (b) Position gain setting limit
If correct gear ratio data is set, increase the position gain value in spindle synchronization.

FS16 <i>i</i> FS0 <i>i</i> -B/C	FS30 <i>i</i> FS0 <i>i</i> -D	Description
4056 to 4059	4056 to 4059	Gear ratio between the spindle and motor
4065 to 4068	4065 to 4068	Position gain in the servo mode/spindle synchronization

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

3.4.33 Alarm Codes 52 and 53

The synchronization signal (ITP) in communication data transferred to and from the CNC stopped.

Troubleshooting when this alarm is issued

- (a) The Spindle Amplifier is faulty.
Replace the Spindle Amplifier or Spindle Amplifier control printed circuit board.
- (b) The CNC is faulty.
Replace the board or module related to the serial spindle.

3.4.34 Alarm Code 54

A large current flowing in the motor for a long time was detected.

Troubleshoot as in the case of alarm code 29.

3.4.35 Alarm Code 55

In spindle switching control or output switching control, a mismatch between the switching request signal (SPSL or RSL) and the power lead state check signal (MCFN, MFNHG, RCH, or RCHHG) continues during motor activation.

Troubleshooting when this alarm is issued

- (a) The magnetic contactor (switch unit) for power lead switching is faulty.
If the contact is inoperative, check the power supply of the magnetic contactor. If the magnetic contactor is still inoperative, replace the magnetic contactor.
- (b) The I/O unit or wiring for checking the contact of the magnetic contactor is faulty.
If a defect is found in the I/O unit or wiring, replace the I/O unit or wiring.
- (c) The sequence (ladder) is incorrect.
Modify the sequence so that switching is not performed during activation. For details of the signals, refer to "FANUC SERVO AMPLIFIER *ai* series Descriptions (B-65282EN)."

3.4.36 Alarm Code 56

The cooling fan for the control circuit section has stopped.

- (a) Poor installation of the control printed-circuit board

Be sure to push the faceplate as far as it will go. (This alarm may be displayed if one of the connectors for connection between the control printed-circuit board and power printed-circuit board is detached.)

- (b) Replace the Spindle Amplifier or its internal cooling fan.

3.4.37 Alarm Code 61

The difference in position between the semi-closed side and closed side exceeded the setting level (parameter No. 4354) for the dual position feedback function.

Troubleshooting when this alarm is issued

- (a) When this alarm is issued at the start of the machine, there may be a setting error in a sensor-related parameter or motor-end position feedback conversion coefficient parameter.
Check whether conversion coefficient parameters Nos. 4171 and 4172 (in high gear) and Nos. 4173 and 4174 (in low gear) are set correctly. Also, refer to the FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN) to check the settings of the sensor-related parameters.

- (b) When the conversion coefficients are set correctly, the level set for parameter No. 4354 may be too low.
- (c) When this alarm is issued for a system which has been operating normally, there may be slippage between the motor and spindle. Check the machine.
- (d) When this alarm is intermittently issued for a system which has been operating normally, a count error may occur in the motor-end or spindle-end position feedback signal due to noise.

3.4.38 Alarm Code 65

A magnetic pole detection error occurred. This spindle alarm is issued for the BiS Series spindle motors (synchronous spindle motors).

Troubleshooting when this alarm is issued

When this alarm is issued at the start, possible causes are all of (a) to (f) below. When the machine has been operating normally, possible causes are (d), (e), and (f).

- (a) There is a setting error in a parameter (number of teeth of a motor sensor or number of phases of a motor).
Check whether the settings of the parameters of the number of teeth of the motor sensor (bits 2, 1, and 0 of parameter No. 4011 and parameter No. 4334) and the number of phases of the motor (bits 7 and 3 of parameter No. 4011 and parameter No. 4368) are correct.
- (b) The phase sequence of the motor power lead differs from that of connection of motor sensor feedback.
- (c) The motor power lead is not connected.
- (d) The motor is locked and cannot move. Alternatively, the excitation current is low and the motor cannot move smoothly due to the effect of friction.
Detect the magnetic pole when the motor can move smoothly.
- (e) The motor sensor or rotor shaft slips and the phase relationship between the motor sensor and rotor changes.
- (f) A count error occurs in the motor feedback signal due to the effect of noise.

3.4.39 Alarm Code 66

An error occurred during communication (connector JX4) between spindle and amplifier.

Troubleshooting when this alarm is issued

- (a) Check the connection between the spindle and amplifier.
- (b) Replace the cable.

3.4.40 Alarm Code 67

The reference position return command was issued for the slave axis in the spindle EGB mode.

Troubleshooting when this alarm is issued

- (a) Reference position return cannot be performed in the spindle EGB mode (G81). Before performing reference position return, turn the EGB mode off (G80).

3.4.41 Alarm Code 69

This alarm can be issued only when Dual Check Safety is in use.

The alarm occurs if, in safety signal mode C (a guard open request was entered to open the guard), the spindle motor rotation speed exceeds the safety speed.

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

Troubleshooting when this alarm is issued

- (a) If the guard is open, observe the safety speed.
- (b) Check the safety speed parameter.
- (c) Replace the Spindle Amplifier control printed-circuit board.

3.4.42 Alarm Code 70

This alarm can be issued only when Dual Check Safety is in use.

The spindle amplifier connection status does not match the hardware setting.

Troubleshooting when this alarm is issued

- (a) Check the Spindle Amplifier connection and its setting.
- (b) Replace the CPU card or Spindle Amplifier control printed-circuit board.

3.4.43 Alarm Code 71

This alarm can be issued only when Dual Check Safety is in use.

A safety parameter error occurred.

Troubleshooting when this alarm is issued

- (a) Re-set the safety parameter.
- (b) Replace the CPU card or Spindle Amplifier control printed-circuit board.

3.4.44 Alarm Code 72

This alarm can be issued only when Dual Check Safety is in use.

The result of the spindle amplifier speed check does not match the result of the CNC speed check.

If the alarm occurs, replace the CPU card in the CNC or the Spindle Amplifier control printed-circuit board.

3.4.45 Alarm Code 73

The signal of the motor sensor is disconnected.

- (1) If this alarm is issued when the motor is deactivated

- (a) The setting of a parameter is incorrect.

Referring to "FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN)," check the parameter for sensor setting.

- (b) The cable is disconnected.

Replace the cable.

- (c) The sensor is not adjusted correctly.

Adjust the sensor signal. If the sensor signal cannot be adjusted correctly, or the sensor signal is not observed, replace the connection cable and sensor.

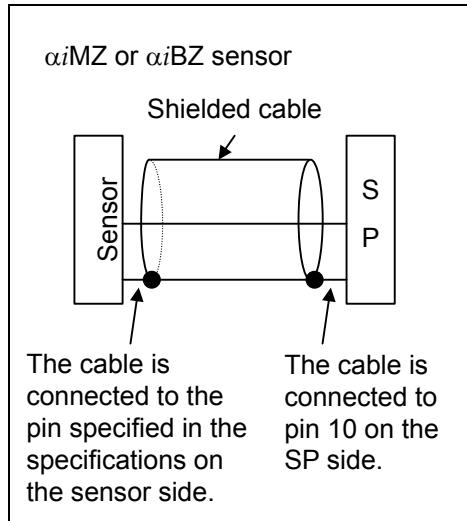

- (d) The Spindle Amplifier is faulty.

Replace the Spindle Amplifier or Spindle Amplifier control printed circuit board.

- (2) If this alarm is issued when the cable is moved (as in the case where the spindle moves)

The conductor may be broken. Replace the cable. If coolant has penetrated into the connector, clean the connector.

- (3) If this alarm is issued when the motor rotates
- The shielding of the cable between the sensor and the Spindle Amplifier is faulty.
Referring to, "Connection," in "FANUC SERVO AMPLIFIER αi series Descriptions (B-65282EN)," check the shielding of the cable.
 - The signal cable is bundled with the servo motor power lead.
If the cable between the sensor and the Spindle Amplifier is bundled with the servo motor power lead, separate them from each other.

3.4.46 Alarm Code 74

This alarm can be issued only when Dual Check Safety is in use.
The CPU test failed to end normally.

When this alarm is issued, Replace the Spindle Amplifier or Spindle Amplifier control printed circuit board.

3.4.47 Alarm Code 75

This alarm can be issued only when Dual Check Safety is in use.
An error occurred in the CRC test.

When this alarm is issued, Replace the Spindle Amplifier or Spindle Amplifier control printed circuit board.

3.4.48 Alarm Code 76

This alarm can be issued only when Dual Check Safety is in use.
The spindle safety function has not been executed.

If the alarm occurs, replace the Spindle Amplifier control printed-circuit board.

3.4.49 Alarm Code 77

This alarm can be issued only when Dual Check Safety is in use.
The result of the spindle amplifier axis number check does not match the result of the CNC axis number check.

If the alarm occurs, replace the CPU card in the CNC or the Spindle Amplifier control printed-circuit board.

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

3.4.50 Alarm Code 78

This alarm can be issued only when Dual Check Safety is in use.

The result of spindle amplifier safety parameter check does not match the result of the CNC safety parameter check.

If the alarm occurs, replace the CPU card in the CNC or the Spindle Amplifier control printed-circuit board.

3.4.51 Alarm Code 79

This alarm can be issued only when Dual Check Safety is in use.

An abnormal operation was detected in the initial test.

When this alarm is issued, Replace the Spindle Amplifier or Spindle Amplifier control printed circuit board.

3.4.52 Alarm Code 80

A spindle alarm was issued for the destination amplifier in inter-Spindle Amplifier communication (connector JX4).

Troubleshooting when this alarm is issued

- (a) There is no problem with the Spindle Amplifier to which this alarm is issued. Check the spindle alarm in the destination amplifier and take appropriate action.

3.4.53 Alarm Code 81

The position where the one-rotation signal of the motor sensor is generated is incorrect.

- (1) If the external one-rotation signal is used

- (a) The settings of parameters are incorrect.

Check that the gear ratio data matches the specification of the machine.

FS15 <i>i</i>	FS16 <i>i</i> FS0 <i>i</i> -B/C	FS30 <i>i</i> FS0 <i>i</i> -D	Description
3171	4171	4171	Denominator of gear ratio between motor sensor and spindle
3173	4173	4173	
3172	4172	4172	Numerator of gear ratio between motor sensor and spindle
3174	4174	4174	

- (b) Slippage between the spindle and motor

Check that there is no slippage between the spindle and motor. The external one-rotation signal is not applicable to V-belt connection.

- (2) Troubleshooting in other cases

- (a) The setting of a parameter is incorrect.

Referring to "FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN)," check the parameter for sensor setting.

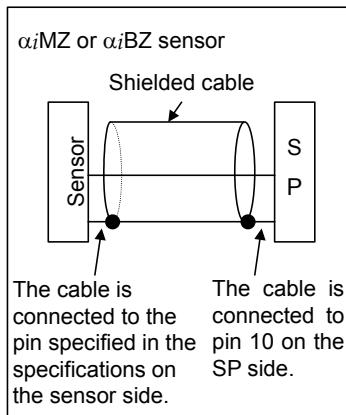

- (b) A sensor (αiMZ sensor or αiBZ sensor) is not adjusted correctly.

Adjust the sensor signal. If the sensor signal cannot be adjusted correctly, or the sensor signal is not observed, replace the connection cable and sensor.

- (c) The shielding of the cable between the sensor and Spindle Amplifier is faulty.

Referring to "Connection," in "FANUC SERVO AMPLIFIER αi series Descriptions (B-65282EN)," check the shielding of the cable.

- (d) The signal cable is bundled with the servo motor power lead.
If the cable between the sensor and Spindle Amplifier is bundled with the servo motor power lead, separate them from each other.
- (e) The Spindle Amplifier is faulty.
Replace the Spindle Amplifier or Spindle Amplifier control printed circuit board.

3.4.54 Alarm Code 82

The one-rotation signal of the motor sensor is not generated.

Troubleshooting when this alarm is issued

- (a) The setting of a parameter is incorrect.
Referring to "FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN)," check the parameter for sensor setting.
- (b) The αiMZ sensor or αiBZ sensor is not adjusted correctly.
Adjust the sensor. If the sensor cannot be adjusted or the signal is not observed, replace the connection cable and sensor.
- (c) The external one-rotation signal is faulty.
Check the check pin EXTSC1 on the spindle check board. If the signal is not generated per rotation, replace the connection cable and position coder.
- (d) The Spindle Amplifier is faulty.
Replace the Spindle Amplifier or Spindle Amplifier control printed circuit board.

3.4.55 Alarm Code 83

The Spindle Amplifier checks the pulse counts of phases A and B each time a one-rotation signal is generated. The alarm is issued when a pulse count beyond the specified range is detected.

- (1) If this alarm is issued when the cable is moved (as in the case where the spindle moves)
The conductor may be broken. Replace the cable. If coolant has penetrated into the connector, clean the connector.
- (2) Troubleshooting in other cases
 - (a) The setting of a parameter is incorrect.
Referring to "FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN)," check the parameter for sensor setting.
 - (b) The αiMZ sensor or αiBZ sensor is not adjusted correctly.
Adjust the sensor. If the sensor cannot be adjusted or the signal is not observed, replace the connection cable and sensor.
 - (c) The shielding of the cable between the sensor and Spindle Amplifier is faulty.
Referring to "Connection," in "FANUC SERVO AMPLIFIER αi series Descriptions (B-65282EN)," check the shielding of the cable.

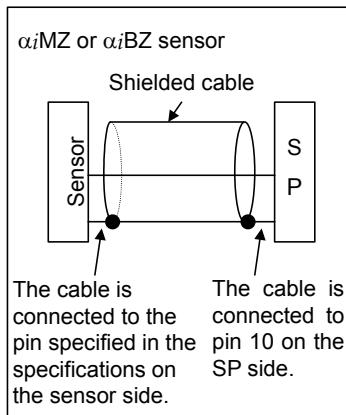

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

- (d) The signal cable is bundled with the servo motor power lead.
If the cable between the sensor and Spindle Amplifier is bundled with the servo motor power lead, separate them from each other.
- (e) The Spindle Amplifier is faulty.
Replace the Spindle Amplifier or Spindle Amplifier control printed circuit board.

3.4.56 Alarm Code 84

The spindle sensor signal was disconnected.

Refer to Alarm Code 73 for this alarm trouble shooting.

3.4.57 Alarm Code 85

The one-rotation signal of the spindle sensor occurred in an incorrect location.

Refer to Alarm Code 81 for this alarm trouble shooting.

3.4.58 Alarm Code 86

No spindle sensor one-rotation signal occurred.

Refer to Alarm Code 82 for this alarm trouble shooting.

3.4.59 Alarm Code 87

A spindle sensor signal is abnormal.

Refer to Alarm Code 83 for this alarm trouble shooting.

3.4.60 Alarm Code 88

The heat sink cooling fan is not running.

If this alarm is issued, replace the Spindle Amplifier heat sink cooling fan.

3.4.61 Alarm Code 89

The submodule SM (SSM) is abnormal. This spindle alarm is issued for the BiS Series spindle motors (synchronous spindle motors).

When this alarm is issued at the start, possible causes are all of (a) to (d) below. When the machine has been operating normally, possible causes are (c) and (d).

Troubleshooting when this alarm is issued

- (a) The Spindle Amplifier does not support the SSM.
Replace the Spindle Amplifier.
- (b) The SSM is not mounted or connected.
Check the connection of the interface signal cable between JYA4 (Spindle Amplifier) and CX31 (SSM).
- (c) The interface signal between the Spindle Amplifier and SSM is disconnected.
Check the connection of the interface signal cable between JYA4 (Spindle Amplifier) and CX31 (SSM).
- (d) The SSM is faulty.
Replace the SSM.

3.4.62 Alarm Code 90

An unexpected rotation state (state in which the polarity in the torque command differs that of acceleration) was detected. This spindle alarm is issued for the BiS Series spindle motors (synchronous spindle motors). When this alarm is issued at the start, possible causes are all of (a) to (d) below. When the machine has been operating normally, it is highly possible that the cause is (c) or (d).

Troubleshooting when this alarm is issued

- (a) There is a setting error in a parameter (number of teeth of the motor sensor or number of phases of the motor).
Refer to the FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN) to check the relevant parameters.
- (b) There is a setting error in an AMR offset-related parameter (No. 4084 or 4085).
Parameter No. 4084 (AMR offset) is adjusted for each machine. Readjust this parameter when the phase relationship between the magnetic pole 0-deg position of the rotor and the one-rotation signal position of the sensor changes due to the replacement of the sensor or slippage of the shaft or when the parameter is loaded from another machine.
Parameter No. 4085 is provided for AMR offset adjustment. Normally, this parameter must be set to "0".
- (c) When this alarm is issued after the spindle is banged, a possible cause is a change to the phase relationship between the motor sensor and rotor due to slippage of the motor sensor or rotor shaft.
- (d) A count error occurs in the motor sensor due to noise.
Apply appropriate countermeasures against noise.

3.4.63 Alarm Code 91

A count error occurred for the magnetic pole position (a large difference between the magnetic pole position at the one-rotation signal position and the setting of parameter No. 4084 (AMR offset) was detected). This spindle alarm is issued for the BiS Series spindle motors (synchronous spindle motors).

When this alarm is issued at the start, possible causes are both (a) and (b) below. When the machine has been operating normally, check (b) and take appropriate action.

Troubleshooting when this alarm is issued

- (a) There is a setting error in a parameter (number of teeth of the motor sensor or number of phases of the motor).
Refer to the FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN) to check the relevant parameters.
- (b) An unnecessary one-rotation signal is generated or a count error occurs for feedback pulses due to slippage of the sensor ring or noise.
Check whether the motor sensor slips. When there is no problem with the motor sensor, take appropriate countermeasures against noise.

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

3.4.64 Alarm Code 92

The actual motor speed exceeded the overspeed level corresponding to the velocity command.

When this alarm is issued at the start, possible causes are all of (a) to (c) below. When the machine has been operating normally, it is highly possible that the cause is noise in (c).

Troubleshooting when this alarm is issued

- (a) There is a setting error in a parameter (number of teeth of the motor sensor or number of phases of the motor).

Refer to the FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN) to check the relevant parameters.

- (b) When a BiS Series spindle motor (synchronous spindle motor) is driven, there is a setting error in an AMR offset-related parameter (No. 4084 or 4085).

Parameter No. 4084 (AMR offset) is adjusted for each machine. Readjust this parameter when the phase relationship between the magnetic pole 0-deg position of the rotor and the one-rotation signal position of the sensor changes due to the replacement of the sensor or slippage of the shaft or when the parameter is loaded from another machine.

Parameter No. 4085 is provided for AMR offset adjustment. Normally, this parameter must be set to "0".

- (d) A count error occurs in the motor sensor due to noise.

Apply appropriate countermeasures against noise.

3.4.65 Alarm Codes A, A1, and A2

The control program is not running.

An error was detected when the control program was running.

- (1) If this alarm is issued when the spindle amplifier power is switched on

- (a) Wrong software specification
(b) Defective printed-circuit board

Replace the Spindle Amplifier or Spindle Amplifier control printed-circuit board.

- (2) If this alarm is issued when the motor is active.

- (a) Influence by noise

Referring to "Installation" in "FANUC SERVO AMPLIFIER αi series Descriptions (B-65282EN)," check the grounding wire. If the spindle sensor signal wire is bundled together with any motor power wire, separate them.

3.4.66 Alarm Code b0

An error occurred in communication between amplifiers (Spindle Amplifier, Servo Amplifier, and Power Supply).

Troubleshooting when this alarm is issued

- (1) If this alarm is issued immediately after the power supply of CNC is turned on

- (a) Check the way the connectors are coupled.
Normally, CXA2A and CXA2B must be coupled.

- (b) The cable is defective.

Check the connection pin number. If there is any problem, correct it.
Alternatively, replace the cable.

- (c) The Spindle Amplifier, Servo Amplifier, or Power Supply is defective.

Replace the Spindle Amplifier, Servo Amplifier, or Power Supply. Alternatively, replace the Spindle Amplifier, Servo Amplifier, or Power Supply control printed-circuit board.

3.4.67 Alarm Codes C0,C1, and C2

An error occurred in serial communication data between the CNC and Spindle Amplifier.

Troubleshooting when this alarm is issued

- (a) The Spindle Amplifier is defective.
Replace the Spindle Amplifier or Spindle Amplifier control printed-circuit board.
- (b) The CNC is defective.
Replace the board or module related to the serial spindle.

3.4.68 Alarm Code C3

In spindle switching, a mismatch is found between the switching request signal (SPSL) and the internal status of the motor/spindle sensor signal switching circuit (submodule SW).

Troubleshooting when this alarm is issued

- The submodule SW (SSW) is defective.
Replace the submodule SW (SSW).

3.4.69 Alarm Code C4

An invalid learning cycle is set in learning control in the time synchronization mode.

Troubleshooting when this alarm is issued

- (a) Check whether the value specified in the velocity command is appropriate.
- (b) Check whether the setting of the learning cycle (parameter No. 4425) is within a range between 20 and 4800.

3.4.70 Alarm Code C5

An invalid value is set for the highest or lowest degree of a dynamic characteristic compensation element in learning control.

Troubleshooting when this alarm is issued

- Decrease the setting of the highest (parameter No. 4427) or lowest (parameter No. 4428) of dynamic characteristic compensation element Gx.

3.4.71 Alarm Code C7

An invalid reference angle cycle is set in learning control in the angle synchronization mode.

Troubleshooting when this alarm is issued

- Increase the setting of parameter No. 4425 (number of divisions per cycle) in learning control.

3.4.72 Alarm Code C8

In spindle synchronization, the speed deviation (difference between the specified speed at the spindle end calculated based on the position error and position gain and the actual speed) exceeded the alarm detection level (parameter No. 4515).

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

- (1) When this alarm is issued immediately after the motor excitation (SFR, SRV) is turned off, then on again in spindle synchronization
This alarm may be issued because the spindle motor is accelerated to eliminate the accumulated position error while the motor excitation is off. Modify the sequence so that the motor excitation is turned off after spindle synchronization is released.
- (2) When this alarm is issued during cutting
(a) A possible cause is overload. Review the cutting conditions.
(b) When no overload occurs, review whether the alarm detection level setting is appropriate.

3.4.73 Alarm Code C9

In spindle synchronization, the position error exceeded the alarm detection level (parameter No. 4516).

For troubleshooting when this alarm is issued, see the subsection about alarm code C8.

3.4.74 Alarm Code d0

In tandem control, the speed polarity relationship between the master motor and slave motor is abnormal.

Troubleshooting when this alarm is issued

Check the setting related to the rotation direction (FS16: bit 2 of parameter No. 4353).

3.4.75 Alarm Code d1

An error occurred during spindle adjustment function operation.

Troubleshooting when this alarm is issued

Refer to the description of the error and action to be taken that are displayed on the SERVO GUIDE.

3.4.76 Alarm Code d2

Communication between the sensor (serial) and Spindle Amplifier is disconnected.

When this alarm is issued at the start, possible causes are all of (a) to (d) below. When the machine has been operating normally, possible causes are (c) and (d).

Troubleshooting when this alarm is issued

- (a) There is a parameter setting error.

Refer to the section, "START-UP," in the FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN) to check the settings of the sensor setting parameters.

- (b) The Spindle Amplifier is not supported.

Check the items related to the section, "PARAMETERS RELATED TO DETECTORS," in the FANUC SERVO AMPLIFIER αi series Descriptions (B-65282EN).

- (c) The cable is broken or connected incorrectly.

Replace the cable or check the connection.

- (d) The Spindle Amplifier is defective.

Replace the Spindle Amplifier or Spindle Amplifier control printed-circuit board.

3.4.77 Alarm Code d3

Serial data between the sensor (serial) and Spindle Amplifier that was received by the Spindle Amplifier was detected being destroyed by noise.

Troubleshooting when this alarm is issued

- (a) Check the shielding of the cable between the sensor (serial) and Spindle Amplifier.
Check the items related to the section, "Detectors," in the FANUC SERVO AMPLIFIER *ai* series Descriptions (B-65282EN).

3.4.78 Alarm Code d4

A change to position data from the sensor (serial) was detected exceeding the expected range.

When this alarm is issued at the start, possible causes are both (a) and (b) below. When the machine has been operating normally, the possible cause is (b).

Troubleshooting when this alarm is issued

- (a) There is a parameter setting error.
Refer to the section, "Parameters Related to Start-up," in the FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN) to check the settings of the sensor setting parameters.
- (b) Check the shielding of the cable between the sensor (serial) and Spindle Amplifier.
Check the items related to the section, "Detectors," in the FANUC SERVO AMPLIFIER *ai* series Descriptions (B-65282EN).

3.4.79 Alarm Code d7

A communication error occurred in an electronic device on the Spindle Amplifier control circuit.

Troubleshooting when this alarm is issued

- The Spindle Amplifier control printed-circuit board becomes loose or the Spindle Amplifier is abnormal.
Check whether the Spindle Amplifier control printed-circuit board is mounted correctly.
When the board is mounted correctly, replace the Spindle Amplifier.

3.4.80 Alarm Code d9

An error occurred in the inner circuit of the sensor (serial).

Troubleshooting when this alarm is issued

- (a) The detection circuit is abnormal.
Replace the detection circuit.

3.4.81 Alarm Code E0

The number of pulses between one-rotation signals of the sensor (serial) is outside the specified range.

Troubleshooting when this alarm is issued

- (a) The detection circuit is abnormal.
Replace the detection circuit.

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

3.4.82 Alarm Code E1

The one-rotation signal of the sensor (serial) was not generated within five rotations after power-on. When this alarm is issued at the start, possible causes are all of (a) to (c) below. When the machine has been operating normally, possible causes are (b) and (c).

Troubleshooting when this alarm is issued

- (a) There is a parameter setting error.

When an invalid number of teeth of the sensor is set, this alarm may be issued because the actual number of rotations does not match the number of rotations calculated by the Spindle Amplifier. Refer to the section, "Parameters Related to Start-up," in the FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN) to check the settings of the sensor setting parameters.

- (b) Sensor adjustment is defective.

Refer to the section, "Detectors," in the FANUC SERVO AMPLIFIER αi series Descriptions (B-65282EN) to adjust the sensor signal.

- (c) The detection circuit is abnormal.

Replace the detection circuit.

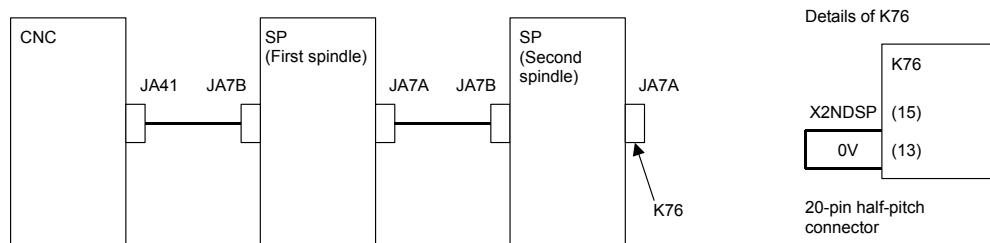

3.4.83 Other Alarms

- (1) If the Spindle Amplifier status display is 4, 11, 30, 33, 51, 57, 58, b1, b2, or b3

This status display means that an alarm condition occurred in the Power Supply. Check the status display of the Power Supply, and see Section 2.3.

- (2) About CNC alarms 756 and 766 (abnormal axis number)

These alarms can be issued only when the Dual Check Safety function is in use. If this alarm is issued, check that K76 shown below is attached to the JA7A connector of the second spindle. K76 is unnecessary if only the first spindle is used. If the wiring is normal, replace the Spindle Amplifier control printed-circuit board.

3.5 **αCi SERIES SPINDLE AMPLIFIER MODULE**

This section explains those alarm codes for the αCi series which require troubleshooting sequences that are different from those for the αi series even when the alarm numbers are the same.

For explanations about the alarm codes not stated herein, see the descriptions about the corresponding number given in Section 2.4, "Spindle Amplifier."

3.5.1 **Alarm Code 12**

An excessive motor current was detected.

An excessively large current flowed into the DC link of the main circuit.

For SPMC-2.2*i* to -15*i*

An overload, overcurrent, or a low control power supply voltage was detected in the power module (IPM) of the main circuit.

(1) If this alarm is issued on SPMC-2.2*i* to -15*i*

Check alarm code 09 as well.

(2) If this alarm is issued immediately after a spindle rotation command is specified

(a) The motor power lead is faulty.

Check for a short circuit between motor power leads and short-circuit to ground, and replace the power lead as required.

(b) The insulation of the motor winding is defective.

If the motor is short-circuited to ground, replace the motor.

(c) The parameters specific to the motor are not set correctly.

Refer to "FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN)."

(d) The SPMC is faulty.

A power element (IGBT, IPM) may be destroyed. Replace the SPMC.

(3) If this alarm is issued during spindle rotation

(a) Belt slippage

It is likely that there may be belt slippage between the spindle and motor. Clean the pulleys and adjust the belt tension.

(b) The parameters specific to the motor are not set correctly.

Referring to "FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN)," check the parameters specific to the motor.

(c) The SPMC is faulty.

A power element (IGBT, IPM) may be destroyed. Replace the SPMC.

If the amplifier setting condition is not satisfied, or cooling is insufficient because the heat sink is dirty, the power elements may be destroyed.

When the heat sink on the back of the amplifier is too dirty, clean the heat sink, for example, by blowing air. Consider the use of a structure that prevents the heat sink from being directly exposed to coolant.

For the installation condition, refer to "FANUC SERVO AMPLIFIER αi series Descriptions (B-65282EN)."

3.TROUBLESHOOTING AND

ACTION

TROUBLESHOOTING

B-65285EN/04

3.5.2 Alarm Code 35

There is a large difference between the motor speed calculated from the position coder and the motor speed estimated with the spindle software.

- (1) If an alarm is issued when a rotation command is entered

- (a) Error in the position coder setting parameter

Correctly specify the bits representing the relationships between the direction of position coder rotation and that of spindle rotation and between the direction of spindle rotation and that of motor rotation.

FS15 <i>i</i>	FS16 <i>i</i>	Description
3000#0	4000#0	Spindle and spindle motor rotation directions
3001#4	4001#4	Spindle sensor (position coder) mounting direction

- (b) Invalid gear ratio parameter setting

Check to see if an incorrect gear ratio has been specified.

This value is used to convert the position coder speed to the motor speed. Be sure to specify the correct value.

FS15 <i>i</i>	FS16 <i>i</i>	Description
3056 to 3059	4056 to 4059	Spindle-motor gear ratio data

- (c) Clutch/gear signal error

Make sure that the entered clutch/gear signals (CTH1A, CTH2A) are correct with respect to the actually selected gear.

	FS15 <i>i</i>	FS16 <i>i</i>	#7	#6	#5	#4	#3	#2	#1	#0
First spindle	G227	G070					CTH1A	CTH2A		
Second spindle	G235	G074					CTH1B	CTH2B		

- (d) Belt slippage between the spindle and spindle motor

Make adjustments so that no belt slippage will occur between the spindle and spindle motor.

- (2) If an alarm is issued during a cutting operation

An overload has occurred to decrease the motor speed.

Review the cutting condition.

4

REPLACING AMPLIFIER COMPONENTS

This chapter describes how to replace a fan motor, absolute Pulsecoder battery, fuses, and printed-circuit board.

⚠ WARNING

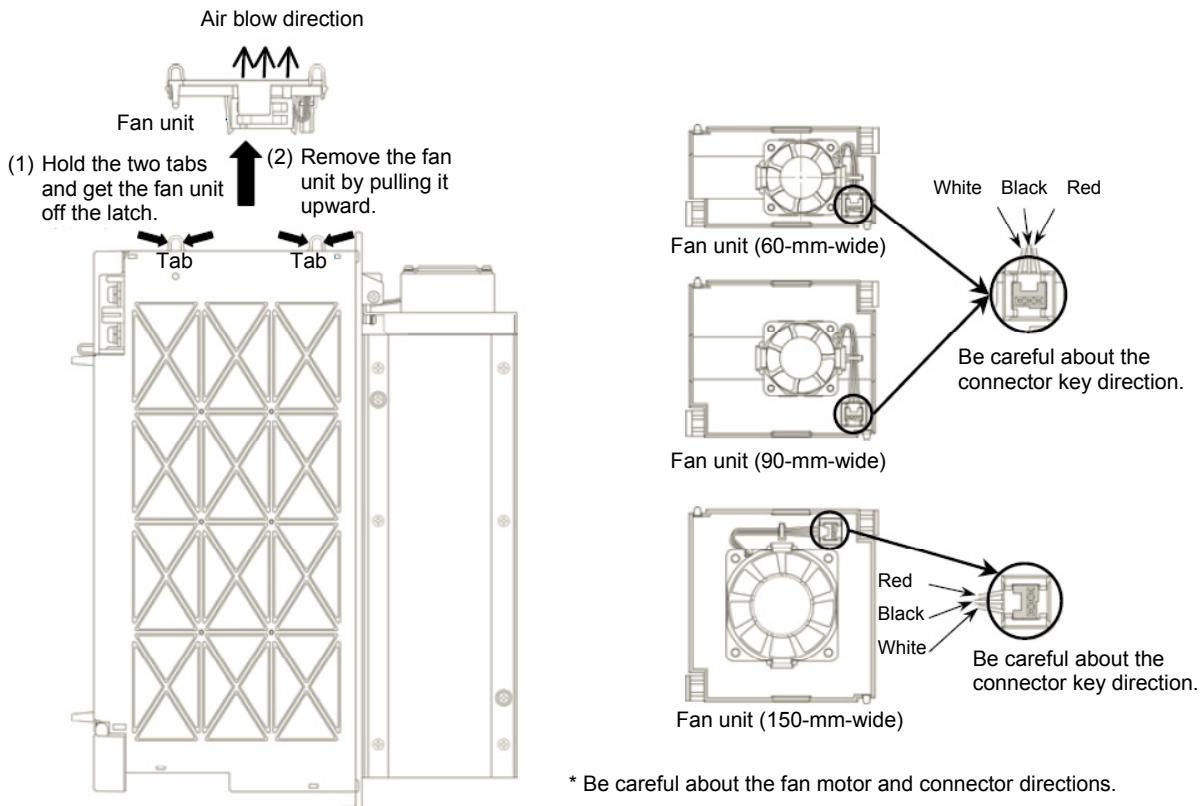

Because the Servo Amplifier uses a large-capacitance electrolytic capacitor internally, the Servo Amplifier remains charged for a while even after the power is turned off. Before touching the Servo Amplifier for maintenance or other purposes, ensure your safety by measuring the residual voltage in the DC link with a tester and confirming that the charge indication LED (red) is off.

4.1 REPLACEMENT OF A FAN MOTOR

(1) Fan motor for internal cooling

Replace the internal fan motor, according to the procedure shown in the figure below.

When replacing the fan motor, be careful about the direction of the fan motor (air blow direction), the direction of the connector, etc.

4.REPLACING AMPLIFIER

COMPONENTS

TROUBLESHOOTING

B-65285EN/04

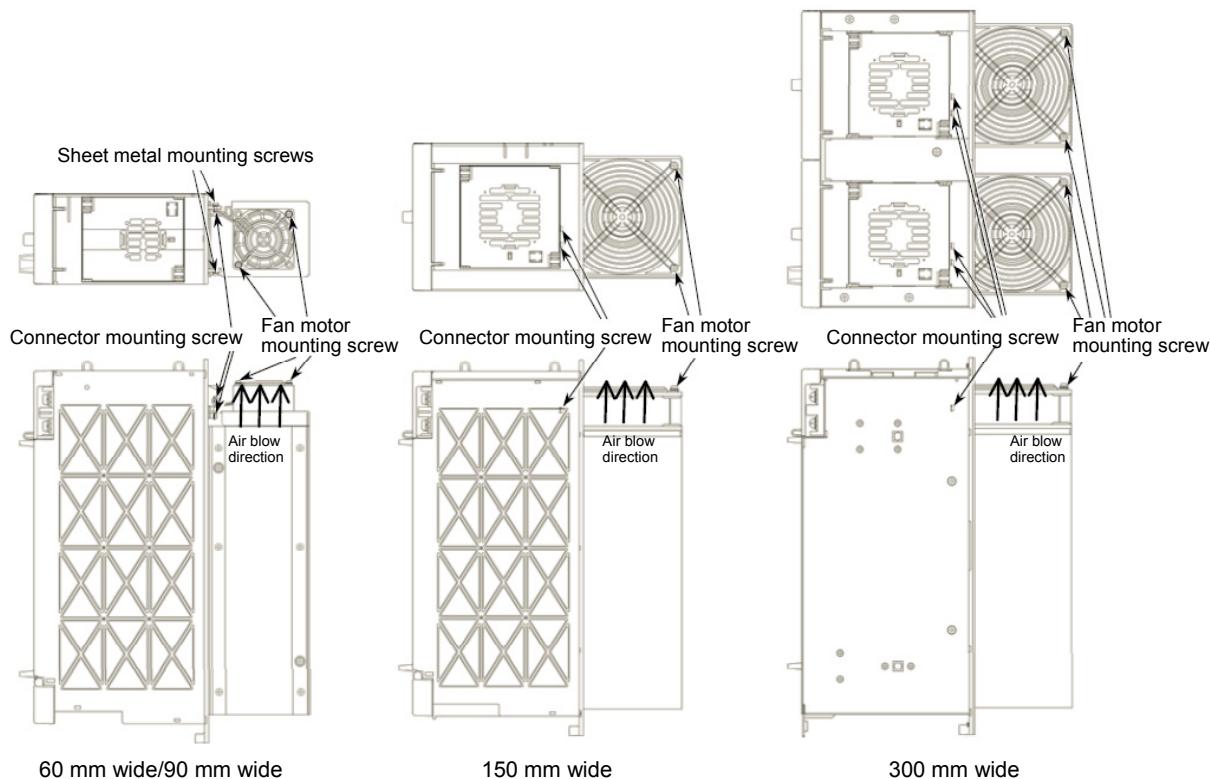

(2) Fan motor for cooling the external radiator

<1> Remove the two sheet metal mounting screws (for the 60-mm-wide model only), and detach the fan motor from the unit together with the sheet metal.

<2> Remove the fan motor mounting screws (two for one fan motor and four for two fan motors).

<3> Remove the connector mounting screws (two and four for the 300-mm-wide model).

When replacing the fan motor, be careful about the direction of the fan motor (air blow direction), the direction of the connector, etc.

4.2 REPLACING BATTERY FOR ABSOLUTE PULSECODERS

4.2.1 Overview

- When the voltage of the batteries for absolute Pulsecoders becomes low, alarm 307 or 306 occurs, with the following indication in the CNC state display at the bottom of the CNC screen.
Alarm 307 (alarm indicating the voltage of the battery becomes low) :
The indication "APC" blinks in reversed display.
Alarm 306 (battery zero alarm) :
The indication "ALM" blinks in reversed display.
- When alarm 307 (alarm indicating the voltage of the battery becomes low) occurs, replace the battery as soon as possible. In general, the battery should be replaced within one or two weeks, however, this depends on the number of Pulsecoders used.
- When alarm 306 (battery zero alarm) occurs, Pulsecoders are reset to the initial state, in which absolute positions are not held. Alarm 300 (reference position return request alarm) also occurs, indicating that reference position return is required.
- In general, replace the batteries periodically within the service life listed below.
 - A06B-6050-K061 or D-size alkaline dry cells (LR20) : Two years (for each six-axis configuration)
 - A06B-6073-K001 : Two years (for each three-axis configuration)
 - A06B-6114-K504 : One year (for each three-axis configuration)

NOTE

The above values indicate the estimated service life of batteries used with FANUC absolute Pulsecoders. The actual battery service life depends on the machine configuration based on, for example, detector types. For details, contact the machine tool builder.

4.2.2 Replacing Batteries

To prevent absolute position information in absolute Pulsecoders from being lost, turn on the machine power before replacing the battery. The replacement procedure is described below.

- <1> Ensure that the power to the servo amplifier is turned on.
- <2> Ensure that the machine is in the emergency stop state (the motor is inactive).
- <3> Ensure that the DC link charge LED of the servo amplifier is off.
- <4> Detach the old batteries and attach new ones.

The replacement of the batteries in a separate battery case and the replacement of the battery built into the servo amplifier are described below in detail.

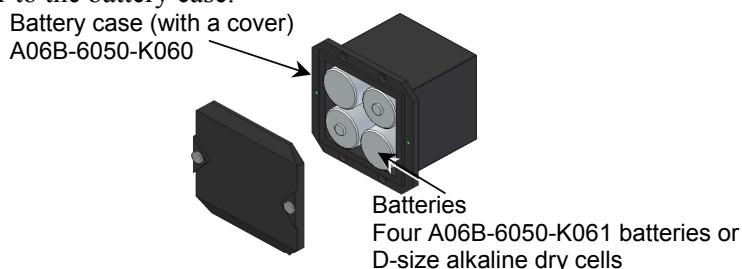

⚠ WARNING

- The absolute PulseCoder of each of the $\alpha i/\alpha i$ S series servo motors and the βi S series servo motors (βi S0.4 to βi S22) has a built-in backup capacitor. Therefore, even when the power to the servo amplifier is off and the batteries are replaced, reference position return is not required if the replacement completes within less than 10 minutes. Turn the power on and replace the batteries if the replacement will take 10 minutes or more.
- To prevent electric shock, be careful not to touch metal parts in the power magnetics cabinet when replacing the batteries.
- Because the servo amplifier uses a large-capacitance electrolytic capacitor internally, the servo amplifier remains charged for a while even after the power is turned off. Before touching the servo amplifier for maintenance or other purposes, ensure your safety by measuring the residual voltage in the DC link with a tester and confirming that the charge indication LED (red) is off.
- Be sure to replace the batteries with specified ones. Pay attention to the battery polarity. If a wrong type of battery is used or a battery is installed with incorrect polarity, the battery may overheat, blow out, or catch fire, or the absolute position information in the absolute Pulsecoders may be lost.
- Ensure that the battery connector is inserted in the correct position.

4.2.3 Replacing the Batteries in a Separate Battery Case

Use the following procedure to replace the batteries in the battery case.

- <1> Loosen the screws on the battery case and detach the cover.
- <2> Replace the batteries in the case (pay attention to the polarity).
- <3> Attach the cover to the battery case.

**⚠ CAUTION**

- Four D-size alkaline dry cells (LR20) that are commercially available can be used as batteries. A set of four A06B-6050-K061 batteries is optionally available from FANUC.
- Replace all the four batteries with new ones. If old and new batteries are mixed, the absolute position information in the absolute Pulsecoders may be lost.

4.2.4 Replacing the Battery Built into the Servo Amplifier

Use the following procedure to replace the special lithium battery.

- <1> Detach the battery case.
- <2> Replace the special lithium battery.
- <3> Attach the battery case.

4.REPLACING AMPLIFIER

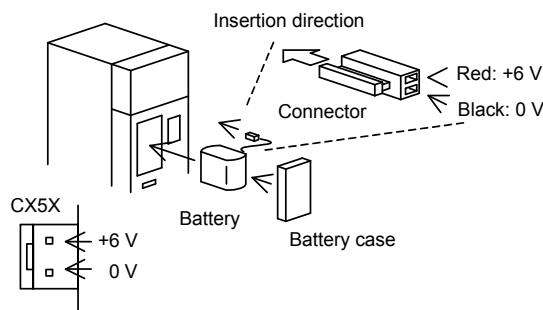

COMPONENTS

TROUBLESHOOTING

B-65285EN/04

CAUTION

- Purchase the battery from FANUC because it is not commercially available. It is therefore recommended that you have a backup battery.
- When the built-in battery is used, do not connect BATL (B3) of connector CXA2A/CXA2B. Also, do not connect two or more batteries to the same BATL (B3) line. These connections are dangerous because battery output voltages may be short-circuited, causing the batteries to overheat.
- Install the battery in the servo amplifier in a direction that allows slack in the cable. If the battery cable is under tension, a bad connection may occur.
- If the +6 V pin and 0 V pin are short-circuited, the battery may overheat, blow out, or catch fire, or the absolute position information in the absolute Pulsecoders may be lost.
- When inserting the connector, align it to the connector pins.

[Battery sets and outlines]

Battery ordering drawing number	Manufacturer model number	Applicable servo amplifier	Battery case ordering drawing number	Outline
A06B-6114-K504 (Note)	BR-2/3AGCT4A (Panasonic)	<i>ai</i> series 60/90 mm width	A06B-6114-K505	
		<i>ai</i> series 150/300 mm width	A06B-6114-K506	

NOTE

When using an old-type battery BR-CCF2TH, order a battery case applicable for battery A06B-6114-K504.

Used batteries

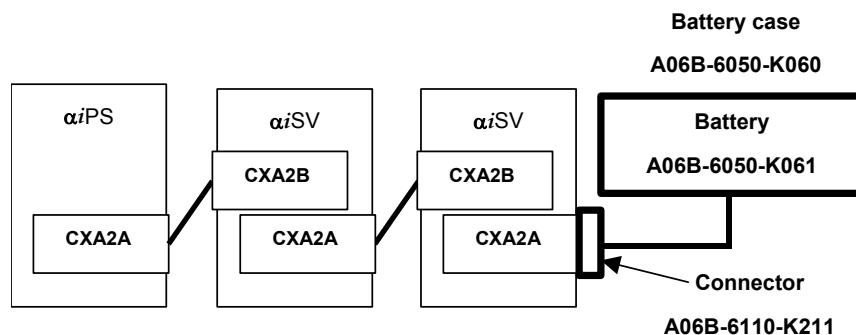

Old batteries should be disposed as "INDUSTRIAL WASTES" according to the regulations of the country or autonomy where your machine has been installed.

4.2.5 Notes on Replacing a Battery (Supplementary Explanation)

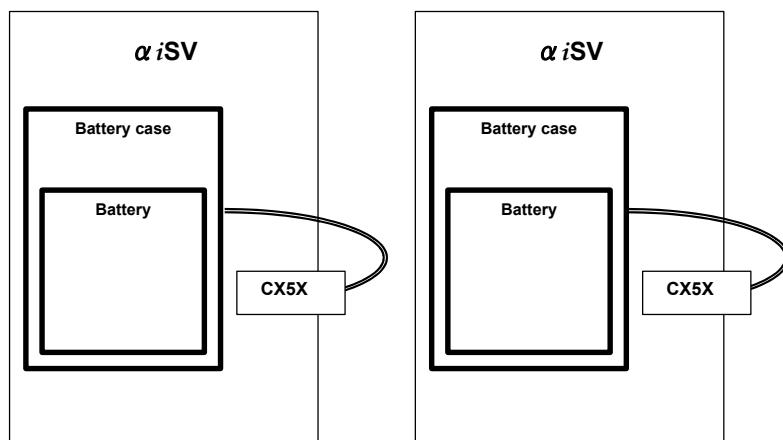

4.2.5.1 Battery connection modes

For absolute Pulsecoders, there are two types of battery connection modes: "Connecting batteries in a separate battery case" and "connecting batteries built into the Servo Amplifier." For details, refer to Subsection 9.3.2.10, "Connecting the battery (for the absolute Pulsecoder)," in the FANUC SERVO AMPLIFIER αi series Descriptions (B-63282EN).

[Batteries in a separate battery case]

[Batteries built into the Servo Amplifier]

4.2.5.2 Connecting the battery for the α series motor

The Pulsecoder for the α series servo motor is not incorporated with a backup capacitor as standard. To keep the absolute position information in the absolute Pulsecoder, you need to keep the control power turned on during battery replacement. Follow the procedure explained below.

[Replacing procedure for the battery]

1. Make sure that the power to the Servo Amplifier is on (the 7-segment LED on the front of the SVM is on).
2. Make sure that the emergency stop button of the system has been pressed.
3. Make sure that the motor is not activated.
4. Make sure that the DC link charge LED of the SVM is off.
5. Remove the old battery, and install a new battery.
6. This completes the replacement. You can turn off the power to the system.

 WARNING

- 1 When replacing the battery, be careful not to touch bare metal parts in the panel. In particular, be careful not to touch any high-voltage circuits due to the electric shock hazard.
- 2 Before replacing the battery, check that the DC link charge confirmation LED on the front of the servo amplifier is off. Neglecting this check creates an electric shock hazard.
- 3 Install the battery with correct polarity. If the battery is installed with incorrect polarity, it may overheat, blow out, or catch fire.
- 4 Avoid a short-circuit between the +6 V and 0 V lines of a battery or cable. A short-circuit may lead to a hot battery, an explosion, or fire.

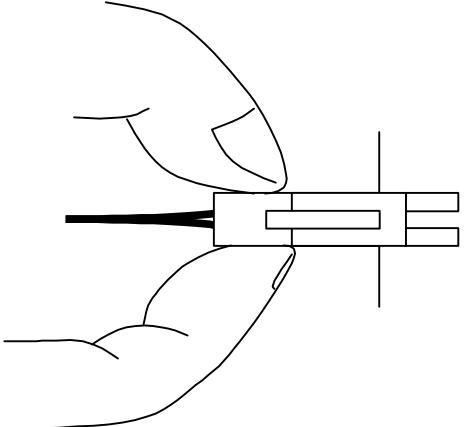

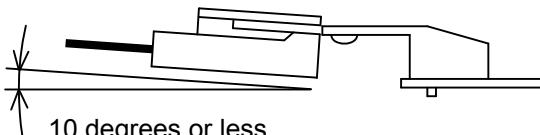

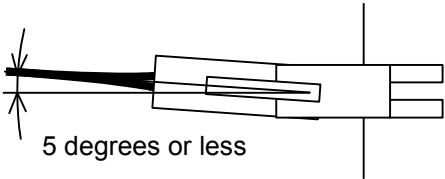

4.2.5.3 Notes on attaching connectors

If an excessive strain is applied to a connector when it is inserted or removed, a poor contact may result. When inserting and removing the battery connector, therefore, be careful not to apply an excessive wrenching force to it; just follow the instructions given in the following table.

(1) Attaching connectors

<1>		Check the attachment position.
<2>	 10 degrees or less	Plug the cable connector while raising it slightly.
<5>	 5 degrees or less	Here, the angle of the cable connector to the horizontal must be 5 degrees or less.
<3>		After passing the lock pin, insert the connector straight.
<4>		The attachment of the connector is completed.

(2) Detaching the connector

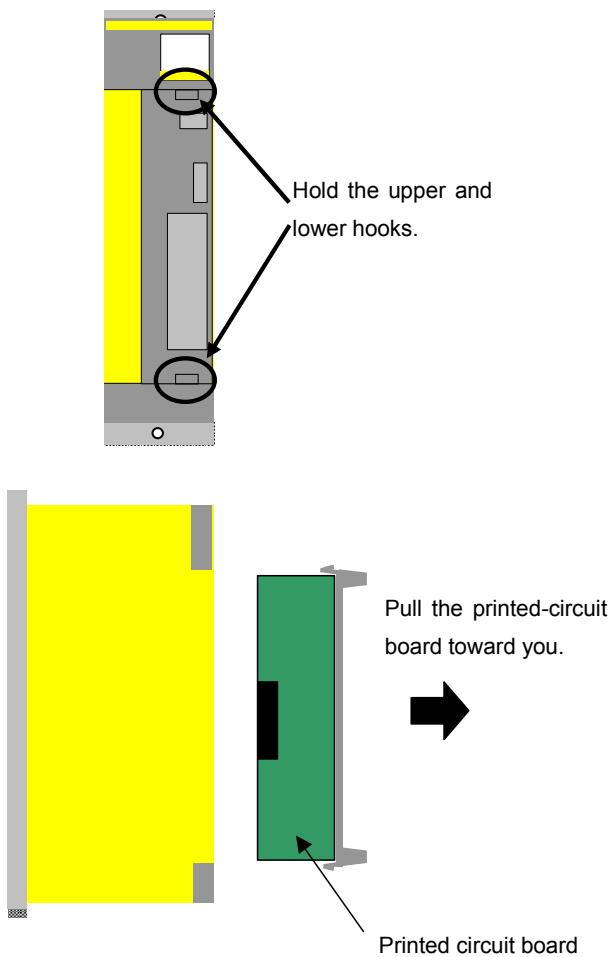

<1>		Hold both the sides of the cable insulator and the cable, and pull them horizontally.
<2>	 <p>10 degrees or less</p>	Pull out the cable side while raising it slightly.
<3>	 <p>5 degrees or less</p>	Here, the angle of the cable to the horizontal must be 5 degrees or less.

4.3 HOW TO REPLACE THE FUSES

In the αi series, a printed-circuit board can be removed and inserted from the front of the servo amplifier. The printed-circuit board removal/insertion procedure is common to the Power Supply, Servo Amplifier, and Spindle Amplifier.

NOTE

- 1 If a fuse blows, it is likely that there is a short-circuit in the power supply for a device (such as a sensor) connected to the Servo Amplifier.
After checking that all devices connected to the Servo Amplifier are normal, replace the fuse.
If you do not remove the cause, it is very much likely that the fuse will blow again.
- 2 Do not use any fuse not supplied from FANUC.
- 3 Before replacing a fuse, check a marking on it with that on the printed-circuit board. Be careful not to mount a fuse with an incorrect rating.

To insert the printed-circuit board, reverse the above procedure.

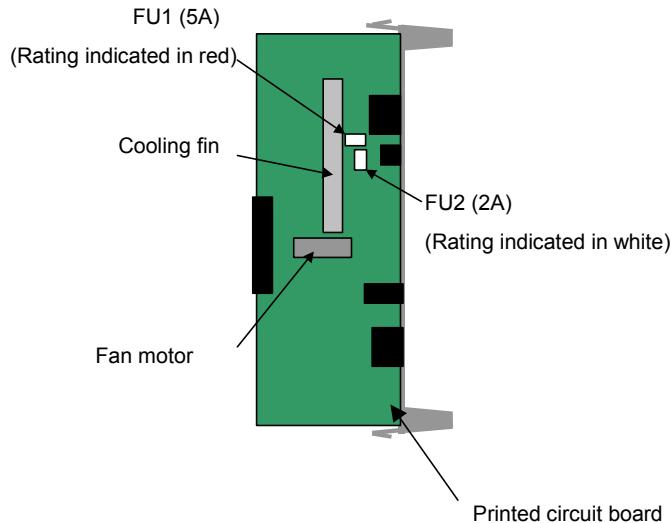

Ensure that the upper and lower hooks snap into the housing.

If the printed-circuit board is not inserted completely, the housing remains lifted. Pull out the printed-circuit board and insert it again.

4.3.1 Fuse Locations

4.3.1.1 Power Supply

There are two different fuses on the Power Supply printed-circuit board. Be careful not to confuse their ratings during replacement.

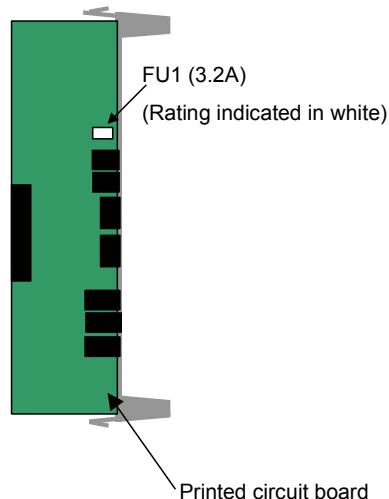

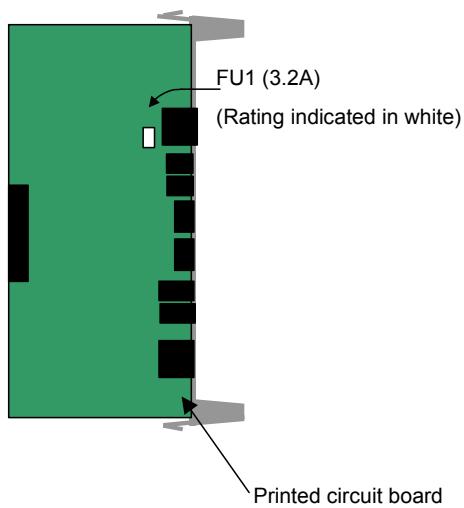

Fuse specification

1**MOTOR/DETECTOR/AMPLIFIER
PREVENTIVE MAINTENANCE****1.1 LIST OF MANUALS RELATED TO MOTORS AND
AMPLIFIERS**

Details of individual motors and amplifiers are described in the manuals listed in the table below. Before performing periodic inspection or any other maintenance work, consult with the machine tool builder and, if necessary, obtain the latest version of the corresponding manual shown in the list. The information about the specifications of each device, such as the weight and winding resistance value, is given in the relevant "DESCRIPTIONS" manual.

Manual name	Type of manual	Specification number
FANUC AC SERVO MOTOR αi series	DESCRIPTIONS	B-65262EN
FANUC AC SERVO MOTOR $\beta i s$ series	DESCRIPTIONS	B-65302EN
FANUC SYNCHROUNOUS BUILT-IN SERVO MOTOR DiS series	DESCRIPTIONS	B-65332EN
FANUC LINEAR MOTOR LiS series	DESCRIPTIONS	B-65382EN
FANUC AC SPINDLE MOTOR αi series	DESCRIPTIONS	B-65272EN
FANUC AC SPINDLE MOTOR βi series	DESCRIPTIONS	B-65312EN

1.2 PREVENTIVE MAINTENANCE OF MOTORS AND DETECTORS

1.2.1 Warnings, Cautions, and Notes on Preventive Maintenance of Motors and Detectors

This subsection contains the safety precautions for motor and detector preventive maintenance, which are classified into "warnings", "cautions", and "notes" according to their bearing on safety. Make sure that you understand and comply with these precautions when carrying out the maintenance work.

WARNING

- **Make sure that you are safely dressed and have a safe working environment when performing preventive maintenance for a motor.**
 - Be dressed safely, e.g. by wearing gloves and safety shoes, to protect against injury due to an edge or protrusion and electric shock.
 - Have the work done by more than one person, where possible, so that immediate action can be taken if an accident occurs when handling a motor.
 - A motor is heavy. When moving it, use a crane or other appropriate equipment to protect against injury. For information about the weight of the motor, refer to its DESCRIPTIONS manual (shown earlier).
 - Clothes or fingers can be caught in a rotating motor or come into contact with a moving part of it. Standing in the direction of motor rotation (direction of motion) can pose a risk of injury. Before rotating a motor, check that there is no object that is thrown away by motor rotation.
- **Be careful about electric shock, fire, and other accidents.**
 - Do not handle a motor with a wet hand.
 - To prevent electric shock, make sure that no conductive object, such as a terminal, is exposed when the motor is powered on.
 - Before touching a motor or any surrounding part, check that the power is shut off and take appropriate safety precautions.
 - High voltage remains across power line terminals of a motor even after the power is shut off (for at least five minutes). Do not touch a motor in such a condition or connect it to other equipment.
 - A loose or disconnected terminal, short-circuited terminals, or a terminal connected to the ground can cause overheating, spark, fire, or damage to the motor. Take appropriate precautions to prevent these accidents.
 - When placed near any inflammable object or material, a motor can be ignited, catch fire, or explode. Avoid placing it near such object or material.
- **Do not disassemble or modify a motor.**

Motors such as linear motors, synchronous built-in servo motors, and synchronous built-in spindle motors contain very strong magnets. If electronic medical apparatus comes near, these motors can cause the apparatus to malfunction, potentially putting the user's life in danger. Also, disassembling or modifying a motor can cause a failure, regardless of the type of motor. Do not disassemble or modify a motor in any way not specified by FANUC.

⚠ CAUTION**• Ensure that the specified cooling conditions are met.**

If the specified cooling conditions are not met (the motor is insufficiently or excessively cooled), the motor can fail. Problems that can cause a motor failure, such as liquid piping clog, leakage, and fan motor trouble, should be eliminated through periodic inspection. Do not drive the motor when the cooling system is in an abnormal condition.

• Do not change the system configuration.

Do not change the configuration of the system when it is running normally. Doing so can cause an accident or failure. If you disconnect a cable for maintenance or some other purpose, take an appropriate measure, such as putting a mark on it, to ensure you can restore the original state.

• Use the tapped holes of a motor only to move the motor.

Do not use the tapped holes of a motor to lift or move any other object along with the motor. Doing so can damage the motor. Depending on the type of motor, the place and direction in which the motor can be lifted may be predetermined. For details, refer to the DESCRIPTIONS manual of the motor (shown earlier).

• Do not touch a motor when it is running or immediately after it stops.

A motor may get hot when it is running. Do not touch the motor before it gets cool enough. Otherwise, you may get burned.

NOTE**• Do not remove a nameplate from a motor.**

The nameplate is used to identify the motor during maintenance work. If a nameplate comes off, be careful not to lose it.

• Do not step or sit on a motor, and avoid applying shock to a motor.

Any of these acts can deform or break the motor or affect its component, crippling the normal motor operation. Do not put a motor on top of another motor.

• Comply with the specified conditions when conducting an electric test (winding resistance test, insulation resistance test, etc.) for a motor or other device or supplying power.

- Conduct an electric test according to the specified method. Conducting such a test by any method that is not specified can damage the motor.
- Do not conduct a dielectric strength test or insulation test for a Pulsecoder or other detector, or do not apply a commercial power source voltage. Doing so can destroy the internal elements.

• Perform preventive maintenance (inspection of the external appearance, measurement of winding resistance, insulation resistance, etc.) and cleaning on a regular basis.

To use a motor safely throughout its entire service life, perform preventive maintenance and cleaning on a regular basis. Be careful, however, because excessively severe inspection (dielectric strength test, etc.) can damage its windings. For information about winding resistance values, refer to the DESCRIPTIONS manual of the motor (its specification number is shown in this manual). Information about insulation resistance is given later in this manual.

NOTE

- This manual is focused on the preventive maintenance work to be performed for a single FANUC motor or detector alone. The information contained herein may not apply depending on the type or configuration of the machine. When reading this manual, refer to the manual of the machine as well. If you have any questions or doubts, do not act on your own; please contact the machine tool builder or FANUC.
- For detailed information about a motor, see the manual list shown earlier and, if necessary, obtain the latest version of the corresponding manual.

1.2.2 Preventive Maintenance of a Motor (Common to All Models)

This subsection describes the common preventive maintenance items to be handled regardless of the model of the motor. For the items specific to a particular motor model, see one of the subsequent subsections that pertains to that particular motor model.

⚠ CAUTION

- The preventive maintenance method differs from machine to machine in many respects. Depending on the machine in use, it may be difficult for the user to perform periodic inspection or cleaning. If you are not sure about anything as to preventive maintenance, consult with the machine tool builder and ensure that you can perform periodic inspection and cleaning.
- The machine should be used within the scope of specification defined by the machine tool builder. Using the machine in any way that is outside the specified scope can reduce the motor's service life or cause a failure.

1.2.2.1 Main inspection items

The following table summarizes the main inspection items for a motor. If any of these items **is found to be abnormal, stop the use of the machine immediately and fix the abnormal part** by repairing or replacing it. At the same time, **identify and remove the cause and take a measure to prevent its recurrence**. If it is difficult to take a preventive measure or to prevent its recurrence, consult with the machine tool builder or FANUC.

Appearance of the motor	Crack or deformation	<ul style="list-style-type: none"> - Check the motor for any scar, crack, deformation, bulge, etc. - If the interior of the motor is visible or there is interference with a peripheral component, it is imperative to replace the motor or the peripheral component. - A light peel-off or scar of the surface may be repairable; consult with FANUC.
	Wet or dirty part	<ul style="list-style-type: none"> - If you find any wet or dirty part, clean it immediately. - A preventive measure is needed if the part in question remains wet continually due to cutting fluid or dew condensation.
Operating conditions	Temperature, humidity, etc.	<ul style="list-style-type: none"> - Comply with the operating conditions of the machine. For details of the operating conditions of a specific motor, refer to the corresponding DESCRIPTIONS manual. Generally, the ambient temperature should be 0°C to 40°C (or 30°C for a spindle unit) and dew condensation is not allowed. In a place subject to severe vibration, the components of the motor may be broken.

1.MOTOR/DETECTOR/AMPLIFIER MOTOR/DETECTOR/AMPLIFIER

PREVENTIVE MAINTENANCE

PREVENTIVE MAINTENANCE

B-65285EN/04

Connection state	Cable	<ul style="list-style-type: none"> - Check for any cable sheath damage, exposed conductor, damaged conduit or cable bearing, abnormal bending, loose terminal, etc. - If there is any trace of fluid flowing, the fluid may have entered the inside of the motor or connector. It is necessary to make a check and take a measure to prevent recurrence.
	Connector/terminal	<ul style="list-style-type: none"> - Check for any cracked, exposed, loose, or removed terminal or connector, etc. - Fluid causes a failure; be sure to remove fluid. - A scarred or damaged connector or terminal needs to be replaced. In the case of a resin molded motor, such as a linear motor, the motor needs to be replaced.
Operation of the motor	Noise/vibration	<ul style="list-style-type: none"> - Check for any abnormal noise or vibration not only when the motor is running (the spindle is rotating) but also when it is stopped. - Abnormal noise heard when the motor is rotating indicates an abnormality of the bearing or a failure inside the motor. - If abnormal noise is generated from the connection section of a Spindle Amplifier, check the following items: Belt connection: Check whether the belt tension is appropriate. Gear connection: Check whether an appropriate value is set for the gear backlash. Coupling connection: Check whether the coupling is free from deformation, crack, and looseness.
	Movement	<ul style="list-style-type: none"> - Check that the motor operates normally and smoothly. - If the circuit breaker trips at the same time the motor starts to operate, it indicates abnormal motor windings.
	Heat	<p>Check whether the motor does not overheat during the normal operation cycle.</p> <p>Note: While the motor is running or immediately after it is stopped, the motor surface may become very hot. Instead of touching the motor directly by hand, use a thermolabel, surface thermometer, etc.</p>
Electric characteristics of the motor	Winding resistance	<p>If the resistance value exceeds the specified range, the motor needs to be replaced.</p> <p>Note: When conducting winding resistance measurement, disconnect the motor from the amplifier and measure the resistance at the power line or connector closest to the motor.</p>
	Insulation resistance	For the measuring method and judgment criteria, see the table that follows.
Cooling fan (for a model with a fan motor)	Noise/vibration	<ul style="list-style-type: none"> - Check that the fan blows air normally without causing abnormal noise or vibration. - If abnormal noise is heard even when the motor is stopped, it indicates a fan motor failure.
	Movement	<ul style="list-style-type: none"> - If the power is on and if the fan does not operate or the fan blades cannot be moved even manually, or if the fan blades are rotating but no cooling wind is blown out, the fan motor may have cutting chips or sludge accumulated in it and needs to be cleaned. - If the fan does not operate normally for any other reason, the fan motor needs to be replaced.

Forcible cooling unit (when using an external cooling unit such as liquid cooling unit)	Dew condensation (over-cooling)	<ul style="list-style-type: none"> - Check that forcible cooling does not cause dew condensation on the motor surface. Dew condensation is likely particularly when the cooling unit continues to run after the machine is stopped. In that case, be sure to make this check. - Dew condensation or water drop on the motor surface can reduce the motor's service life. It is necessary to wipe it dry and take a measure to prevent recurrence.
	Liquid leakage/clog	<ul style="list-style-type: none"> - Check the cooling pipe for leakage or clog. Do not drive the motor unless the leakage or clog is fixed. - Liquid leakage from a spindle motor with a through hole indicates a failure of the coolant joint. In this case, the joint needs to be replaced. - In the case of liquid leakage from a linear motor (coil slider), the linear motor (coil slider) needs to be replaced. - If the motor gets wet due to liquid leakage or any other cause, it is necessary to clean and dry the motor and perform electric characteristic checks (winding resistance/insulation resistance).

Insulation resistance measurement

The following table shows the judgment criteria to be applied when measuring insulation resistance between winding and frame using a megohmmeter (500 VDC).

Insulation resistance	Judgment
100M Ω or higher	Acceptable
10M to 100M Ω	The winding has begun deteriorating. There is no problem with the performance at present. Be sure to perform periodic inspection.
1M to 10M Ω	The winding has considerably deteriorated. Special care is in need. Be sure to perform periodic inspection.
Lower than 1M Ω	Unacceptable. Replace the motor.

If insulation resistance drops sharply during a short period of time or if the circuit breaker trips, the cutting fluid or other foreign matter may have entered the inside of the motor or cable. In that case, contact the machine tool builder or FANUC for instructions.

⚠ CAUTION

- Let the motor dry and cool to room temperature before winding or insulation resistance is measured. Otherwise, not only an accurate measurement cannot be performed but also the motor may be damaged.
- The winding or insulation resistance measurement should be performed on the motor alone, with its power line disconnected. Measuring insulation resistance with the motor connected to the amplifier may damage the amplifier.
- During insulation resistance measurement, applying voltage to the motor for a long time may further deteriorate the insulation of the motor. Therefore, the measurement of insulation resistance should be performed in a minimum amount of time where possible.
- When disconnecting the power line and other cables, take an appropriate measure, such as labeling, to ensure that they can be restored to their original state.

1.2.2.2 Periodic cleaning of a motor

Periodic cleaning is necessary to remove an accumulation of cutting chips or sludge that may eventually cause a failure. Also, leaving the cutting fluid or other chemical substance attached for a long time can reduce the motor's service life substantially. When forcible cooling is provided by a liquid or air cooling unit, check the unit for pipe clog, fan failure, etc. and perform cleaning periodically to ensure that the coolant flows smoothly and that the motor is cooled properly.

⚠ WARNING

Depending on the type of motor, the handling may involve a risk and require safety education in advance. Also, some machines are difficult for users to clean on their own. If you are to clean the motor, consult with the machine tool builder in advance with regard to the cleaning method, safety education, etc.

1.2.2.3 Notes on motor cleaning

A motor is an electric product, which is incompatible with most kinds of fluid. When removing cutting chips, sludge, cutting fluid, etc. during cleaning, note the following.

Note on cleaning	Measure
Do not sprinkle fluid. Do not wash by submerging.	Do not sprinkle or spray detergent or any other fluid over the motor (including its peripheral components), or do not wash the motor by submerging it in such fluid. When cleaning the motor, use a cloth moistened with a small amount of neutral detergent so that the fluid does not enter the inside the motor.
Do not use solvent.	Solvent may damage the motor; do not use one. If the dirt is difficult to remove with neutral detergent, use a cloth moistened with a small amount of industrial alcohol (e.g., IPA). Be careful, however, because rubbing with force or repeatedly may damage the coated or resin surface.
Do not leave the motor wet or moistened.	If the motor is wet or moistened after cleaning, dry it before supplying power and before performing electric tests. When drying the motor in an oven, make sure that the temperature is below 40°C and that hot air does not blow directly against the motor.

1.2.2.4 Notes on the cutting fluid (informational)

Depending on the type of cutting fluid used, the motor and amplifier may be affected greatly. Take due care because, even if you ensure that they do not come into direct contact with the fluid, a mist or atmosphere of the fluid can cause the problems described below.

Type of cutting fluid requiring care	Expected problem
Cutting fluid containing highly active sulfur	Some types of cutting fluid contain highly active sulfur. If such cutting fluid enters the inside of the motor or amplifier, it causes copper, silver, and other kinds of metal to corrode, leading to a component failure.
Synthetic cutting fluid with high permeability	Some types of cutting fluid containing such substance as polyalkylene glycol have very high permeability. Such cutting fluid permeates into the inside of the motor, causing insulation deterioration or component failure.
Highly alkaline, water-soluble cutting fluid	Some types of cutting fluid that enhance their alkaline property using such substance as alkanolamine remain highly alkaline - pH10 or higher - when diluted. If such cutting fluid is left attached for a long time, its chemical change will deteriorate the resin and other materials of the motor and amplifier.

Other types of cutting fluid not mentioned above may cause various unexpected problems. If any problem arises for which the cutting fluid is thought to be responsible, consult with the machine tool builder or FANUC.

1.2.3 Routine Inspection of a Spindle Motor with a Through Hole

- Check whether coolant does not always leak from the drain on the rotation joint support housing. (See Fig. 2)
- Check whether coolant does not always leak from the notch on the rotation joint support housing. (See Fig. 2)
- Check whether coolant leaking from the coolant joint does not leak from the coupling. (See Fig. 3)
- Check whether leaking coolant is not collected in the coupling box.

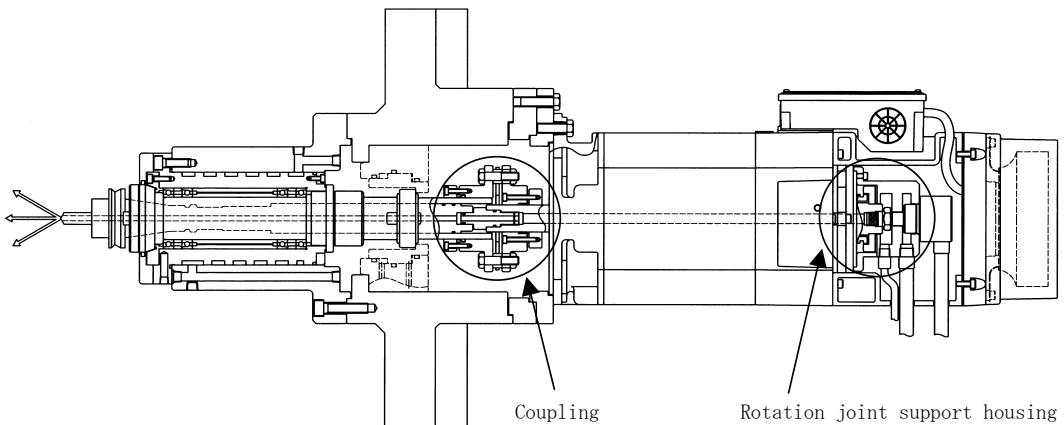

Fig. 1: Example of using a coolant-through spindle motor

Rotation joint support housing

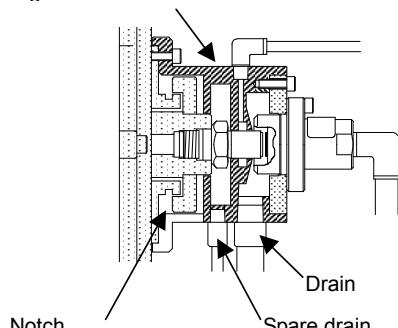

Fig. 2: Rotation joint support housing

Convex type

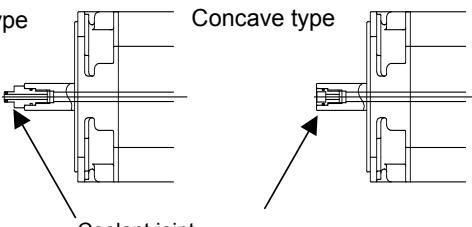

Fig. 3: Example of a coolant joint

1.2.4 Preventive Maintenance of a Built-in Spindle Motor and Spindle Unit

This subsection contains the safety precautions you need to bear in mind when performing preventive maintenance for a built-in spindle motor (BiL or BiS Series) or the FANUC-NSK spindle unit. In some cases, the work may involve a life-threatening risk or cause substantial damage. Make sure that you fully understand these safety precautions before carrying out the work.

 WARNING

- Do not disassemble the spindle. Particularly, the rotor of a synchronous built-in spindle motor (BiS Series) uses strong permanent magnets. The strong magnet force may cause injury or medical appliance malfunction.
- Do not operate a synchronous built-in spindle motor with an external engine. Doing so is very dangerous because it makes the motor act as a power generator, generating high voltage. A power outage is also dangerous because the motor runs freely and, again, generates high voltage. As a safety precaution, a sub module SM (SSM) is connected between motor and amplifier. Do not disconnect the SSM under any circumstances. Also, connect the machine frame to the ground to prevent electric shock.
- A synchronous built-in spindle motor may perform a pole position detection operation when it receives the first rotation command after it is powered on or recovers from an alarm. The pole position detection operation takes 20 to 60 seconds to complete, during which the spindle behaves oddly, e.g., rotating clockwise and counterclockwise alternately in rapid succession. This phenomenon is not abnormal. During the detection operation, do not touch or look down at the spindle, which is a dangerous act.

 CAUTION

Performing a test run described in Chapter 3, "TEST RUN METHOD", in Part IV, of "FANUC - NSK SPINDLE UNIT series DESCRIPTIONS (B-65352EN)" and the inspection and maintenance work described in this manual is the condition for guaranteeing the operation of the FANUC-NSK spindle unit. Be sure to perform the test run and inspection and maintenance work as instructed.

1.2.4.1 Routine inspection of the FANUC-NSK spindle unit

Perform the following routine inspections every day at the start of operation so that stable performance can be obtained from the spindle.

	Item	Check
1	Check if the axis, when turned manually, rotates lightly and smoothly.  WARNING When turning the axis manually, be sure to turn off the power to the machine.	
2	Check if cuttings and coolant residuals are attached to the periphery of a slinger.	
3	Check if dust such as cuttings is attached to the spindle taper portion.	
4	For operation at $15,000 \text{ min}^{-1}$ or more immediately after power-up, increase the speed gradually by using the spindle override function. (This substitutes for a simple test run.)	
5	Check if an abnormal sound is generated.	
6	Check if an abnormal vibration is generated.	
7	Check if an abnormal heat is generated.	

1.2.4.2 Maintenance of the FANUC-NSK spindle unit

A FANUC-NSK spindle unit with a grease unit requires periodical maintenance for consumable/wear parts, such as supplying grease. Depending on the use frequency of and damage to parts, **maintenance generally becomes necessary after two years of machine operation or 10,000 hours of spindle operation.**

Contact FANUC or the machine tool builder when maintenance becomes necessary. Also, an effective way to reduce the machine down time due to maintenance is to prepare spare parts; consult with the machine tool builder.

1.2.4.3 Test run of the FANUC-NSK spindle unit

If any of the following cases applies, be sure to contact the machine tool builder and perform a test run as described in **Chapter 3, "TEST RUN METHOD", in Part IV, of "FANUC - NSK SPINDLE UNIT series DESCRIPTIONS (B-65352EN)"**.

- If the spindle unit is rotated for the first time after it is unpacked or attached to the machine
- If the machine or spindle unit has undergone transportation or relocation
- If the spindle unit alone has been stored for a period longer than six months or has not been used for one month or more after installation

 **CAUTION**

FANUC assumes no responsibility for any damage resulting from the failure to perform a test run or improper use of the spindle unit.

1.2.4.4 Storage method of the FANUC-NSK spindle unit

Apply rust-proof oil to the surface of the spindle unit, pack the spindle unit, and store the packed spindle unit at a location that satisfies the conditions described below. Also, follow the "This Side Up" and "No Pile Up" instructions indicated on the pack surface.

- Indoor well ventilated place not exposed to direct sunlight (place where the temperature varies little, the room temperature is within 5°C to 40°C, and the humidity is 35% to 85% RH)
- Place on the shelf subject to little vibration and dust (Do not place the spindle unit directly on the floor; vibration and dust can damage the bearing or other parts of the spindle.)

Before using the spindle unit after a storage period of one month or more, make necessary checks, such as measuring winding and insulation resistance, examining the appearance for rust and other problems, and checking whether the axis can be turned manually. Depending on the storage period, a test run may be necessary (described earlier).

1.2.5 Preventive Maintenance of a Linear Motor

The magnet plate of a linear motor contains very strong magnets. When performing the maintenance work, make sure all those engaged in the work fully understand the potential risks involved.

 **WARNING**

- The FANUC linear motors use very strong magnets. Improper handling of the motor is very dangerous and can lead to a serious accident. Particularly, a person wearing a pacemaker or other medical apparatus should stay away from the linear motor; otherwise, the apparatus may malfunction, potentially resulting in a life-threatening accident.
- Those who will come near or touch a linear motor for maintenance work should receive safety education in advance. For details, contact the machine tool builder or FANUC.

1.2.5.1 Appearance inspection of the linear motor (magnet plate)

Perform an appearance inspection as well during cleaning or other maintenance work. A crack, chip, deformation, or any other abnormality in appearance of the motor can lead to a serious failure in the not-so-distant future. If you find any such abnormality, be sure to report it to the machine tool builder. A scratch or other slight scar on the motor surface can also be a sign of future trouble and needs to be addressed with care. Some suggested appearance inspection items for the magnet plate are described below.

- * For the coil slider (the side to which the power line is connected), see "Main inspection items" earlier in this manual.

Appearance of the magnet plate (which may have a stainless cover)

Appearance inspection item	Measure
Crack or chip in the magnet plate resin Deformation or bulge of the magnet plate or softening of the resin	The magnet plate needs to be replaced. If unattended, it can cause trouble in the not-so-distant future. If the problem is extremely minor, consult with the machine tool builder or FANUC.
The magnet is exposed, or the resin or magnet is floating	The magnet plate needs to be replaced urgently.
Scratch on the magnet plate	Foreign matter may have entered into the motor, or interference between parts is likely. It is necessary to eliminate the cause and take a measure to prevent recurrence.
Floating, bulging, or deformed stainless cover	The cover or magnet plate needs to be replaced.

1.2.6 Maintenance of a Detector

CAUTION

- Detectors such as Pulsecoders are precision equipment. When handling a detector, avoid applying shock to it. Also, exercise care to prevent cutting powder, dust, cutting fluid, or other foreign matter from attaching to it.
- Make sure that all connectors are connected properly and securely. A connection failure can cause an alarm or some other problem.
- If the detector and/or connectors are not installed securely, cutting fluid may enter the inside of the detector, making it necessary to replace the detector. In that case, contact the machine tool builder or FANUC.

NOTE

If you use a detector not manufactured by FANUC, contact the machine tool builder or detector manufacturer for detailed information on the detector.

1.2.6.1 Alarms for built-in detectors (α_i and β_i Pulsecoders) and troubleshooting actions

These alarms concern built-in detectors that are connected directly to the control unit (CNC/servo amplifier).

Based on the alarm number and description, take an appropriate action as described in the following subsection, "Detailed troubleshooting methods".

Alarm No.: Alarm	Description	Possible cause	Action	Detailed troubleshooting method
361: ABNORMAL PHASE DATA(INT)	- Communication error in the Pulsecoder - ID data error	- Pulse coder failure - Noise	Replace the Pulsecoder.	(3) (4)
364: SOFT PHASE ALARM(INT)	Position data alarm	- Noise - Entry of cutting fluid	Check the effect of noise. Replace the Pulsecoder.	(1) (3)
365: BROKEN LED(INT)	LED disconnection	- Pulse coder failure	Replace the Pulsecoder.	(3)

Alarm No.: Alarm	Description	Possible cause	Action	Detailed troubleshooting method
366: PULSE MISS(INT)	Small internal signal amplitude	- Pulse coder failure - Noise	Replace the Pulsecoder.	(3) (4)
367: COUNT MISS(INT)	Position data count error	- Pulse coder failure - Noise	Replace the Pulsecoder.	(3) (4)
368: SERIAL DATA ERROR(INT)	Communication interruption	- Cable disconnection - Pulse coder failure - Noise	Check the cable. Replace the Pulsecoder.	(2) (3) (4)
369: DATA TRANS. ERROR(INT)	Communication data alarm	- Noise	Check the effect of noise.	(1)
453: SPC SOFT DISCONNECT ALARM	Position - pole data error	- Pulse coder failure - Entry of cutting fluid	Replace the Pulsecoder.	(3)

1.2.6.2 Alarms for separate detectors and troubleshooting actions

These alarms concern separate detectors that are connected to the control unit via a separate detector interface unit (SDU).

Based on the alarm number and description, take an appropriate action as described in the following subsection, "Detailed troubleshooting methods".

Alarm No.: Alarm	Description	Possible cause	Action	Detailed troubleshooting method
380: BROKEN LED(EXT)	LED disconnection	- Detector failure	Replace the detector.	(4)
382: COUNT MISS(EXT)	Position data count error			
383: PULSE MISS(EXT)	Small internal signal amplitude			
384: SOFT PHASE ALARM(EXT)	Position data alarm			
385: SERIAL DATA ERROR(EXT)	Communication interruption	- Cable disconnection - Noise - Detector failure	Check the cable. Check the effect of noise. Replace the detector.	(2) (1) (4)
386: DATA TRANS. ERROR(EXT)	Communication data alarm	- Noise	Check the effect of noise.	(1)
381: ABNORMAL PHASE (EXT)		For details, contact the machine tool builder or detector manufacturer.		
387: ABNORMAL ENCODER(EXT)				

1.2.6.3 Detailed troubleshooting methods

(1) Checking the effect of noise

Check CNC diagnosis information No.356 (Built-in detector), No.357 (Separate detector).

Normally, 0 is displayed. However, if the position data from the Pulsecoder becomes unstable due to noise or some other factor, this value is incremented. The value is cleared when the CNC unit is powered off. Immediately after the power is turned on, 0 is displayed.

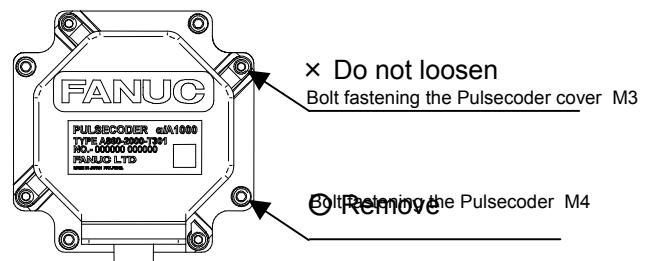

(2) Checking the cable

Check whether the feedback cable is not disconnected and whether the connector is properly plugged.

(3) Replacing the Pulsecoder

(3)-1 Pulse coder replacement procedure

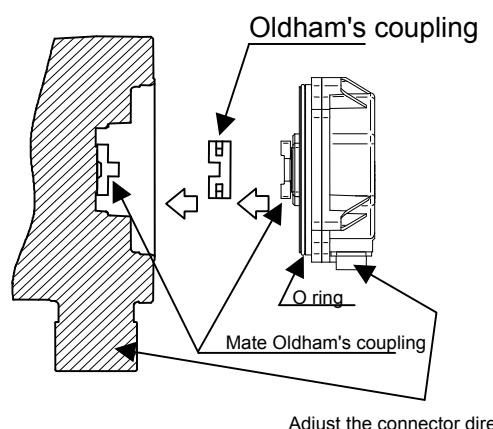

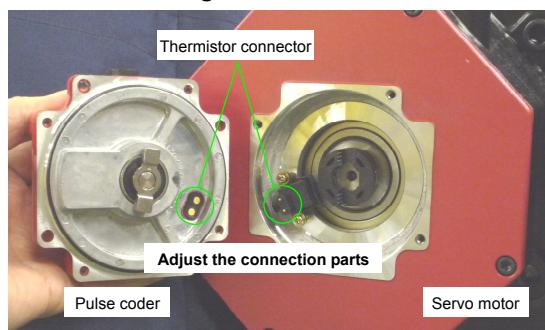

<1> Remove the four M4 hexagon socket head cap screws fastening the Pulsecoder. The M3 bolts fastening the Pulsecoder cover do not need to be loosened. (See the figure at right.)

<2> Remove the Pulsecoder and Oldham's coupling (see the following figure).

<3> Set the new Pulsecoder and Oldham's coupling on the motor. Adjust the direction of the mate Oldham's coupling to that of the Oldham's coupling so that the teeth are engaged.

Push in the Pulsecoder until the O ring fits in the joint between the motor and Pulsecoder. Take care so that the O ring of the Pulsecoder is not bitten.

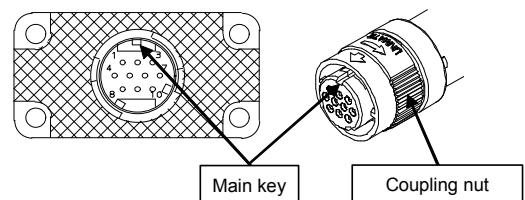

Adjust the connector direction

Attach the Pulsecoder in such a direction that the power connector of the servo motor and the feedback cable of the Pulsecoder face the same direction or that the thermistor connection parts of the servo motor and Pulsecoder match each other (see the figure at left).

<4> Fastening the Pulsecoder with the four M4 hexagon socket head cap screws. (Appropriate torque: 1.5 Nm)

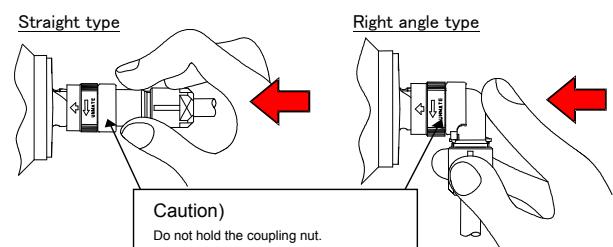

(3)-2 Feedback cable plugging procedure

Plug in the feedback cable connector, as instructed in the procedure below, and check that the connector is securely connected.

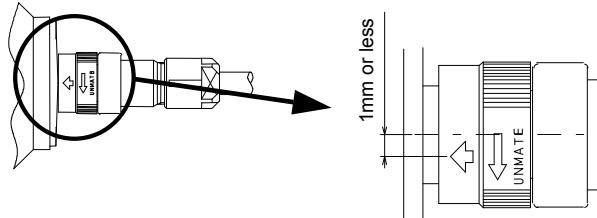

<1> Check the plugging side and key direction.
Check that the plugging side is free of foreign matter, such as dirt or oil.

<2> Plug in the feedback cable connector.
Hold the connector, as shown in the figure at right. Plug in the connector until you hear a click.

<3> Check the connection condition.

1. Check that the arrow mark of the connector is at the center, as shown in the figure at right. If the arrow mark is not at the center, turn the coupling nut manually until the mark comes to the appropriate position.

2. Hold the connector by the same part as in <2>, and pull it lightly to check that the connector does not come off. Do not pull the cable.

(4) If troubleshooting is difficult for the user

If the problem is difficult for the user to troubleshoot because it is due to a detector failure or noise, consult with the machine tool builder or FANUC.

1.2.6.4 Maintenance of βiS motor Pulsecoders

Problems concerning the Pulsecoders of the motors listed in the table below require the maintenance (replacement) of the entire motor (it is not possible to maintain the Pulsecoder alone).

Motor model	Motor specification	Remarks
βiS 0.2/5000	A06B-0111-Bx03	x=1,2,4,5
βiS 0.3/5000	A06B-0112-Bx03	
βiS 0.4/5000	A06B-0114-Bx03#0y00	x=1,2,4,5 y=0,1
βiS 0.5/6000	A06B-0115-Bx03#0y00	
βiS 1/6000	A06B-0116-Bx03#0y00	

1.3 PREVENTIVE MAINTENANCE OF SERVO AMPLIFIERS

1.3.1 Warnings, Cautions, and Notes on Operation of Servo Amplifiers

This subsection contains the safety precautions on preventive maintenance of a servo amplifier (a generic term to refer to the power supply, servo amplifier, spindle amplifier, and other sub modules of a motor drive unit). These precautions are classified into "warnings", "cautions", and "notes" according to their bearing on safety. Make sure that you understand and comply with these precautions when carrying out the maintenance work.

WARNING

- **Make sure that you are safely dressed and have a safe working environment when performing preventive maintenance for a servo amplifier.**
 - Be dressed safely, e.g. by wearing gloves and safety shoes, to protect against injury due to an edge or protrusion and electric shock.
 - Have the work done by more than one person, where possible, so that immediate action can be taken if an accident occurs when handling a motor.
 - A servo amplifier and AC reactor contain heavy components. Be careful when transporting them or mounting them on the power magnetic cabinet. Also be careful not to get your fingers caught between the power magnetics cabinet and servo amplifier.
- **Before turning on the power, check that the door of the power magnetics cabinet and all other doors.**
 - Ensure that the door of the power magnetics cabinet containing the servo amplifier, as well as all other doors, are closed and locked except during maintenance work.
- **When the need arises to open the door of the power magnetics cabinet, only a person trained in the maintenance of the corresponding machine or equipment should do the task after shutting off the power supply to the power magnetics cabinet by opening both the input circuit breaker of the power magnetics cabinet and the factory switch used to supply power to the cabinet.**
- **Be careful about electric shock, fire, and other accidents.**
 - If the machine must be operated with the door open for adjustment or some other purpose, the operator must keep his or her hands and tools well away from any dangerous voltages. Such work must be done only by a person trained in the maintenance of the machine or equipment.
 - Ensure that the door of the power magnetics cabinet is locked so that the door cannot be opened by anyone, except service personnel or a qualified person trained in maintenance to prevent electric shock, when the servo amplifier is powered on.
 - When the need arises for an operator to open the door of the power magnetics cabinet and perform an operation, ensure that the operator is sufficiently educated in safety or that a protective cover is added to prevent the operator from touching any dangerous part.
 - The servo amplifier contains a large-capacity electrolytic capacitor in it and remains charged for a while after the power is shut off. Before touching the servo amplifier for maintenance or some other purpose, measure the residual voltage of the DC link connection using a tester and check that the red LED for indicating charging is in progress is not lit, in order to ensure safety.
 - After wiring, be sure to close the servo amplifier cover.

- A loose screw or poor connector contact can cause a motor malfunction or overheating, connection to ground, or short-circuit. Be extremely careful with power supply lines, motor power lines, and DC link connections through which a large electric current flows, because a loose screw or poor connector contact may lead to a fire. Tighten screws and connectors using the specified screw tightening torque.
- The surfaces of the regenerative discharge unit and heat radiator may become very hot. Do not touch them directly by hand.
- **When operating the machine for the first time after preventive maintenance, check that the machine operates as instructed.**
 - To check whether the machine operates as instructed, first specify a small value for the motor and then increase the value gradually. If the motor operates abnormally, perform an emergency stop immediately.
 - When pressing the emergency stop button, check that the motor stops immediately and that the power being supplied to the amplifier is shut off by the magnetic contactor.
- **Notes on alarms**
 - If the machine stops due to an alarm, check the alarm number. Depending on the alarm issued, if the power is supplied without replacing the failed component, another component may be damaged, making it difficult to identify the original cause of the alarm.
 - Before resetting an alarm, ensure that the original cause of the alarm has been removed.
- **If the motor causes any abnormal noise or vibration while operating, stop it immediately.**
 - Using the motor in spite of the abnormal noise or vibration may damage the servo amplifier.
- **Do not disassemble or modify a servo amplifier.**

Do not disassemble or modify a servo amplifier in any way not specified by FANUC; doing so can lead to a failure.

CAUTION

- **Notes on servo amplifier replacement and wiring**
 - The work of servo amplifier replacement and wiring should be carried out by a person trained in the maintenance of the machine and equipment concerned.
 - When replacing a servo amplifier, check that the combination of the amplifier and the motor is appropriate.
 - Check that the servo amplifier is securely mounted on the power magnetics cabinet. If there is any clearance between the power magnetics cabinet and the surface on which the amplifier is mounted, dust entering the gap may hinder the normal operation of the servo amplifier.
 - Ensure that the power supply lines, motor power lines, and signal lines are each connected to the correct terminal or connector.
 - Unless otherwise instructed, do not unplug a connector and plug it back with the power on; doing so may cause the servo amplifier to fail.
 - When mounting or unmounting the servo amplifier, exercise care not to get your fingers caught between the servo amplifier and power magnetics cabinet.
 - Take care not to lose track of removed screws. Turning on the power with any lost screw left in the unit may damage the machine.
 - Exercise care to prevent the power supply lines and motor power lines from being connected to the ground or being short-circuited.
 - Protect the lines from any stress such as bending. Handle the line ends appropriately.

- **Be careful about the handling of a servo amplifier.**
 - Do not disassemble a servo amplifier. Doing so poses the risk of electric shock, because the capacitor may remain charged.
 - Do not apply shock to a servo amplifier. Doing so may damage its components, potentially causing the amplifier to malfunction.
 - Do not apply an excessively large force to plastic parts. If a plastic section breaks, it may damage internal parts, thus hindering normal operation or leading to a risk of injury due to a broken section.
- **Be careful about the operating environment of a servo amplifier.**
 - Prevent conductive, combustible, or corrosive foreign matter, mist, or drops of water from entering the inside of the unit. The entry of any such material may cause the unit to explode, break, malfunction, etc.
 - Exercise care to prevent cutting fluid, oil mist, cutting chips, or other foreign matter from attaching to the radiator or fan motor exposed to the outside of the power magnetics cabinet. Otherwise, the servo amplifier may become unable to meet its specifications. The service lives of the fan motor and semiconductors can also be reduced.
- **Clean the heat sink and fan motor on a regular basis.**
 - Replace the filter of the power magnetics cabinet on a regular basis.
 - Before cleaning the heat sink, shut down the power and ensure that the temperature of the heat sink is as cool as the room temperature. The heat sink is very hot immediately after power shutdown, touching it may cause burn injury.
 - When cleaning the heat sink by blowing air, be careful about dust scattering. Conductive dust attached to the servo amplifier or its peripheral equipment can lead to a failure.

NOTE

- **Make sure that there is sufficient maintenance clearance around the doors of the machine and equipment.**
- **Do not step or sit on the servo amplifier, or do not apply shock to it.**
- **Do not remove a nameplate from a motor.**
 - The nameplate is necessary to identify the servo amplifier during maintenance work.
 - If a nameplate comes off, be careful not to lose it.

NOTE

- This manual is focused on the preventive maintenance work to be performed for a FANUC servo amplifier. The information contained herein may not apply depending on the type or configuration of the machine. When reading this manual, refer to the manual of the machine as well. If you have any questions or doubts, do not act on your own; please contact the machine tool builder or FANUC.
- For detailed information about a servo amplifier, see the manual list shown earlier and, if necessary, obtain the latest version of the corresponding manual.

1.3.2 Preventive Maintenance of a Servo Amplifier

To use a servo amplifier safely throughout its entire service life, perform daily and periodic inspections.

⚠ CAUTION

- The preventive maintenance method differs from machine to machine in many respects. Depending on the machine in use, it may be difficult for the user to perform periodic inspection or cleaning. If you are not sure about anything as to preventive maintenance, consult with the machine tool builder and ensure that you can perform periodic inspection and cleaning.
- The machine should be used within the scope of specification defined by the machine tool builder. Using the machine in any way that is outside the specified scope can reduce the servo amplifier's service life or cause a failure.

Inspection part	Inspection item	Inspection interval		Judgment criterion
		Routine	Periodic	
Operating environment	Ambient temperature	V		Around the power magnetics cabinet: 0°C - 45°C Inside the power magnetics cabinet: 0°C - 55°C
	Humidity	V		90% or below RH (dew condensation not allowed)
	Dust/oil mist	V		There shall be no dust or oil mist attached near the servo amplifier.
	Cooling air path	V		The cooling fan shall be operating normally without the air flow being interrupted.
	Abnormal vibration/noise	V		- No abnormal noise or vibration shall be present that has not been experienced in the past. - Vibration near the servo amplifier shall be 0.5 G or less.
	Supply voltage	V		200-V input type: Within 200 - 240 V 400-V input type: Within 400 - 480 V
Servo amplifier	General	V		There shall be no abnormal noise or smell, and there shall be no dust or oil mist attached.
	Screw		V	There shall be no loose screw.
	Fan motor ^(NOTE 1, 2)	V		- There shall be no abnormal vibration or noise, and the fan blades shall be rotating normally. - There shall be no dust or oil mist attached.
	Connector		V	There shall be no loose or broken connector.
	Cable		V	There shall be no sign of overheating or sheath deterioration (discoloration or crack).
CNC	Absolute ^(NOTE 2) Pulse coder battery	V		The machine operator's panel or screen shall not display the alarm indicating the battery voltage of the absolute Pulsecoder is low.
External equipment	Magnetic contactor		V	The contactor shall not rattle or chatter.
	Ground fault interrupter		V	The interrupter shall be able to trip.
	AC reactor		V	There shall be no hum.

NOTE

- Fan motors are periodic-replacement parts. It is recommended to inspect fan motors on a routine basis and replace them in a preventive manner.
- Fan motors and batteries are periodic-replacement parts. It is recommended to keep spare parts.

1.3.3 Maintenance of a Servo Amplifier

1.3.3.1 Display of the servo amplifier operation status

The STATUS LEDs on the front of the servo amplifier indicate the operation status of the servo amplifier (whether it is operating normally, the type of alarm, etc.). Use these LEDs for maintenance, inspection, troubleshooting, etc.

⚠ CAUTION

A servo amplifier failure may arise from a combination of multiple causes, in which case it can be difficult to identify all those causes. Handling the failure in an improper way may worsen the problem. It is therefore important to analyze the failure status minutely and identify the true cause or causes of the failure. There may be cases in which the failure appears to have been fixed but later recurs or cause a more serious trouble. If you are not sure about the root cause of or corrective action for a failure, do not act on your own; please contact the machine tool builder or FANUC for instructions on proper action.

(1) Power supply

STATUS LED position	STATUS display	Description
		The STATUS LED is off. Control power has not been supplied, cable is faulty, or control power circuit is defective.
		Not ready status The main circuit is not supplied with power (magnetic contactor is off); emergency stop state. When blinking: Power is off.
		Ready status The main circuit is supplied with power (magnetic contactor is on); the power supply is ready for operation. When blinking: Power is off.
		Warning state (The dot at the lower right lights.) The power supply has failed; an alarm has occurred after a certain time of operation. The warning type is indicated by the character displayed.
		Alarm status The alarm type is indicated by the character displayed.

(2) Servo amplifier

STATUS LED position	STATUS display	Description
		The STATUS LED is off. Control power has not been supplied, cable is faulty, or control power circuit is defective.
		The control power is short-circuited (- blinks). Cable failure
		Waiting for the READY signal from the CNC.
		Ready status The servo motor is excited.
		Alarm status The alarm type is indicated by the character displayed.

(3) Spindle amplifier

STATUS LED position	STATUS display	Description
		The STATUS LED is off. Control power has not been supplied, cable is faulty, or control power circuit is defective.
		After control power is turned on, the spindle software series is displayed (for approx. 1 second). The last two digits of the spindle software series number are displayed.
		The spindle software version is displayed (for approx. 1 second following the display of the spindle software series). [Display] 01,02,03, ... → [Version] A, B, C, ...
		The CNC is not powered on (- blinks). Waiting for serial communication and parameter loading completion.
		Parameter loading completed The motor is not excited.
		Ready status The spindle motor is excited.
		Alarm status The alarm type is indicated by the character displayed.
		Error status (invalid sequence or parameter setting error) The error type is indicated by the character displayed.

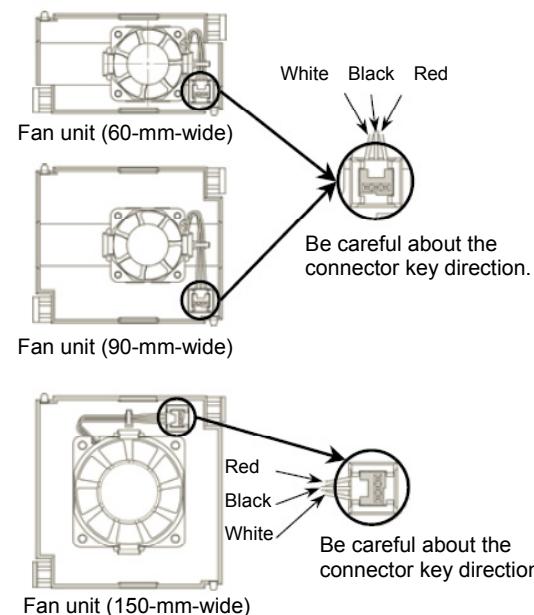

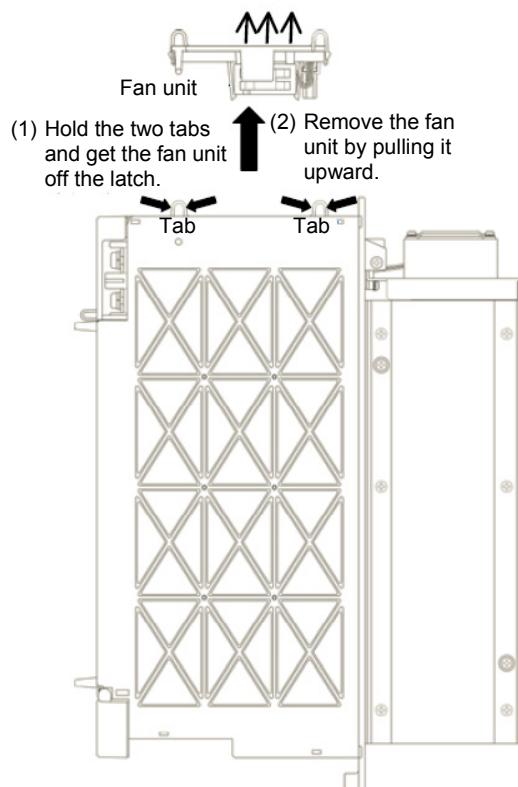

1.3.3.2 Replacement of a fan motor

(1) Fan motor for internal cooling

Replace the internal fan motor, according to the procedure shown in the figure below.

When replacing the fan motor, be careful about the direction of the fan motor (air blow direction), the direction of the connector, etc.

Air blow direction

* Be careful about the fan motor and connector directions.

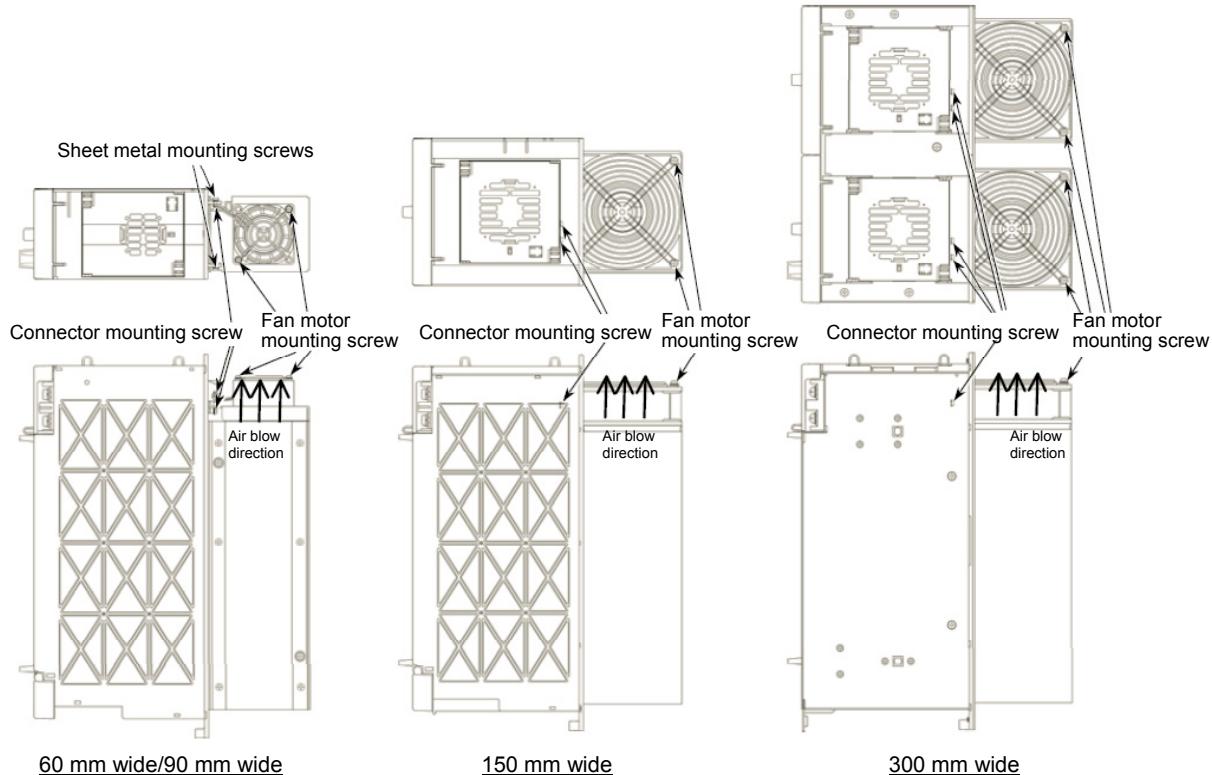

(2) Fan motor for cooling the external radiator

<1> Remove the two sheet metal mounting screws (for the 60-mm-wide model only), and detach the fan motor from the unit together with the sheet metal.

<2> Remove the fan motor mounting screws (two for one fan motor and four for two fan motors).

<3> Remove the connector mounting screws (two and four for the 300-mm-wide model).

When replacing the fan motor, be careful about the direction of the fan motor (air blow direction), the direction of the connector, etc.

1.4 REPLACING BATTERY FOR ABSOLUTE PULSECODERS

1.4.1 Overview

- When the voltage of the batteries for absolute Pulsecoders becomes low, alarm 307 or 306 occurs, with the following indication in the CNC state display at the bottom of the CNC screen.
Alarm 307 (alarm indicating the voltage of the battery becomes low) :
The indication "APC" blinks in reversed display.
Alarm 306 (battery zero alarm) :
The indication "ALM" blinks in reversed display.
- When alarm 307 (alarm indicating the voltage of the battery becomes low) occurs, replace the battery as soon as possible. In general, the battery should be replaced within one or two weeks, however, this depends on the number of Pulsecoders used.
- When alarm 306 (battery zero alarm) occurs, Pulsecoders are reset to the initial state, in which absolute positions are not held. Alarm 300 (reference position return request alarm) also occurs, indicating that reference position return is required.
- In general, replace the batteries periodically within the service life listed below.
 - A06B-6050-K061 or D-size alkaline dry cells (LR20) : Two years (for each six-axis configuration)
 - A06B-6073-K001 : Two years (for each three-axis configuration)
 - A06B-6114-K504 : One year (for each three-axis configuration)

NOTE

The above values indicate the estimated service life of batteries used with FANUC absolute Pulsecoders. The actual battery service life depends on the machine configuration based on, for example, detector types. For details, contact the machine tool builder.

1.4.2 Replacing Batteries

To prevent absolute position information in absolute Pulsecoders from being lost, turn on the machine power before replacing the battery. The replacement procedure is described below.

- <1> Ensure that the power to the servo amplifier is turned on.
- <2> Ensure that the machine is in the emergency stop state (the motor is inactive).
- <3> Ensure that the DC link charge LED of the servo amplifier is off.
- <4> Detach the old batteries and attach new ones.

The replacement of the batteries in a separate battery case and the replacement of the battery built into the servo amplifier are described below in detail.

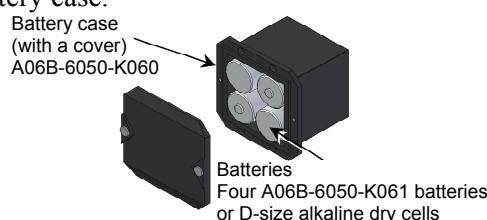

⚠ WARNING

- The absolute Pulsecoder of each of the $\alpha i/\alpha iS$ series servo motors and the βiS series servo motors ($\beta iS0.4$ to $\beta iS22$) has a built-in backup capacitor. Therefore, even when the power to the servo amplifier is off and the batteries are replaced, reference position return is not required if the replacement completes within less than 10 minutes. Turn the power on and replace the batteries if the replacement will take 10 minutes or more.
- To prevent electric shock, be careful not to touch metal parts in the power magnetics cabinet when replacing the batteries.
- Because the servo amplifier uses a large-capacitance electrolytic capacitor internally, the servo amplifier remains charged for a while even after the power is turned off. Before touching the servo amplifier for maintenance or other purposes, ensure your safety by measuring the residual voltage in the DC link with a tester and confirming that the charge indication LED (red) is off.
- Be sure to replace the batteries with specified ones. Pay attention to the battery polarity. If a wrong type of battery is used or a battery is installed with incorrect polarity, the battery may overheat, blow out, or catch fire, or the absolute position information in the absolute Pulsecoders may be lost.
- Ensure that the battery connector is inserted in the correct position.

1.4.3 Replacing the Batteries in a Separate Battery Case

Use the following procedure to replace the batteries in the battery case.

- <1> Loosen the screws on the battery case and detach the cover.
- <2> Replace the batteries in the case (pay attention to the polarity).
- <3> Attach the cover to the battery case.

⚠ CAUTION

- Four D-size alkaline dry cells (LR20) that are commercially available can be used as batteries. A set of four A06B-6050-K061 batteries is optionally available from FANUC.
- Replace all the four batteries with new ones. If old and new batteries are mixed, the absolute position information in the absolute Pulsecoders may be lost.

1.4.4 Replacing the Battery Built into the Servo Amplifier

Use the following procedure to replace the special lithium battery.

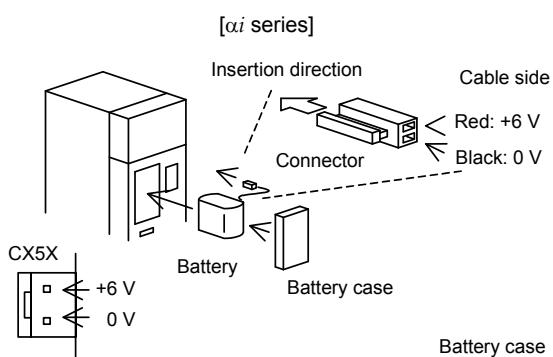

- <1> Detach the battery case.
- <2> Replace the special lithium battery.
- <3> Attach the battery case.

⚠ CAUTION

- Purchase the battery from FANUC because it is not commercially available. It is therefore recommended that you have a backup battery.
- When the built-in battery is used, do not connect BATL (B3) of connector CXA2A/CXA2B. Also, do not connect two or more batteries to the same BATL (B3) line. These connections are dangerous because battery output voltages may be short-circuited, causing the batteries to overheat.
- Install the battery in the servo amplifier in a direction that allows slack in the cable. If the battery cable is under tension, a bad connection may occur.
- If the +6 V pin and 0 V pin are short-circuited, the battery may overheat, blow out, or catch fire, or the absolute position information in the absolute Pulsecoders may be lost.
- When inserting the connector, align it to the connector pins.

[Connecting the battery]

The battery for the αi series amplifiers is mounted at the front of each of the amplifiers.

[Battery sets and outlines]

Battery ordering drawing number	Manufacturer model number	Applicable servo amplifier	Battery case ordering drawing number	Outline
A06B-6114-K504 (Note)	BR-2/3AGCT4A (Panasonic)	αi series 60/90 mm width	A06B-6114-K505	
		αi series 150/300 mm width	A06B-6114-K506	

NOTE

When using an old-type battery BR-CCF2TH, order a battery case applicable for battery A06B-6114-K504.

Used batteries

Old batteries should be disposed as "INDUSTRIAL WASTES" according to the regulations of the country or autonomy where your machine has been installed.

IV. MOTOR MAINTENANCE

1**SERVO MOTOR MAINTENANCE****1.1 SERVO MOTOR MAINTENANCE PARTS****1.1.1 Pulsecoder**

The following lists the ordering specification numbers for maintenance.

(1) Pulsecoder: ordering specification

Motor model	Motor specification	PulseCoder: ordering specification			
<i>αiS</i> series <i>αiF</i> series	A06B-02aa-BccX (aa, cc : Any)	X=0	A860-2000-T301	<i>αiA</i> 1000	Standard specification
		X=1	A860-2005-T301	<i>αiI</i> 1000	Standard specification
		X=2	A860-2001-T301	<i>αiA</i> 16000	Standard specification
	A06B-02aa -BccX #0100 (aa, cc : Any)	X=0	A860-2000-T321	<i>αiA</i> 1000	IP67 specification
		X=1	A860-2005-T321	<i>αiI</i> 1000	IP67 specification
		X=2	A860-2001-T321	<i>αiA</i> 16000	IP67 specification

(2) Oldham's coupling: ordering specification

Motor model	Motor specification	Oldham's coupling: ordering specification
<i>αiS</i> series	A06B-02aa-BccX	
<i>αiF</i> series	(aa, cc, X : Any)	A290-0501-V535

1.1.2 Cooling Fan

The following lists the ordering specification numbers of cooling fan units.

αiS 50 with Fan, *αiS* 60 with Fan, *αiF* 40 with Fan

Motor model	Model name	Motor specification	Fan unit: ordering specification	Remark
<i>αiS</i> series <i>αiF</i> series	<i>αiS</i> 50/3000 with Fan <i>αiS</i> 50/3000HV with Fan	A06B-0275-BXaX A06B-0276-BXaX (X : Any, a=1 or 3)	A06B-0241-K053	200VAC 1-phase
	<i>αiS</i> 60/3000 with Fan <i>αiS</i> 60/3000HV with Fan	A06B-0278-BXaX A06B-0279-BxaX (X : Any, a=1 or 3)		
	<i>αiF</i> 40/3000 with Fan	A06B-0257-BXaX (X : Any, a=1 or 3)		

αiS 100 to *αiS* 500

Motor model	Model name	Motor specification	Fan unit: ordering specification	Remark
<i>αiS</i> series	<i>αiS</i> 100/2500 with Fan <i>αiS</i> 200/2500 with Fan <i>αiS</i> 300/2000 <i>αiS</i> 500/2000	A06B-0285-BX1X A06B-0288-BX1X A06B-0292-BX1X A06B-0295-BX1X (X : Any)	A290-0281-V053	200VAC 3-phase
	<i>αiS</i> 100/2500HV with Fan <i>αiS</i> 200/2500HV with Fan <i>αiS</i> 300/2000HV <i>αiS</i> 300/3000HV <i>αiS</i> 500/2000HV <i>αiS</i> 500/3000HV	A06B-0286-BX1X A06B-0289-BX1X A06B-0293-BX1X A06B-0290-BX1X A06B-0296-BX1X A06B-0297-BX1X (X : Any)		

αiS 1000HV to *αS* 3000HV

Motor model	Model name	Motor specification	Fan unit: ordering specification	Remark
<i>αiS</i> series	<i>αiS</i> 1000/2000HV	A06B-0298-BX1X (X : Any)	A290-0298-V054	AC400V 3-phase
	<i>αiS</i> 1000/2000HV	A06B-0098-BXXX (X : Any)	A290-0098-V051	
	<i>αiS</i> 1000/3000HV	A06B-0099-BXXX (X : Any)	A290-0098-V050	
	<i>αiS</i> 2000/2000HV <i>αiS</i> 3000/2000HV	A06B-0091-BX4X A06B-0092-BX4X (X : Any)	A290-0091-T054	

1.2 REPLACING COOLING FANS

This section describes how to replace cooling fan units.

For each motor, replace the cooling fan unit according to the procedure.

⚠ CAUTION

Before replacing a fan motor, remove the power lead to the fan motor and check that the rotation of the fan motor stops.

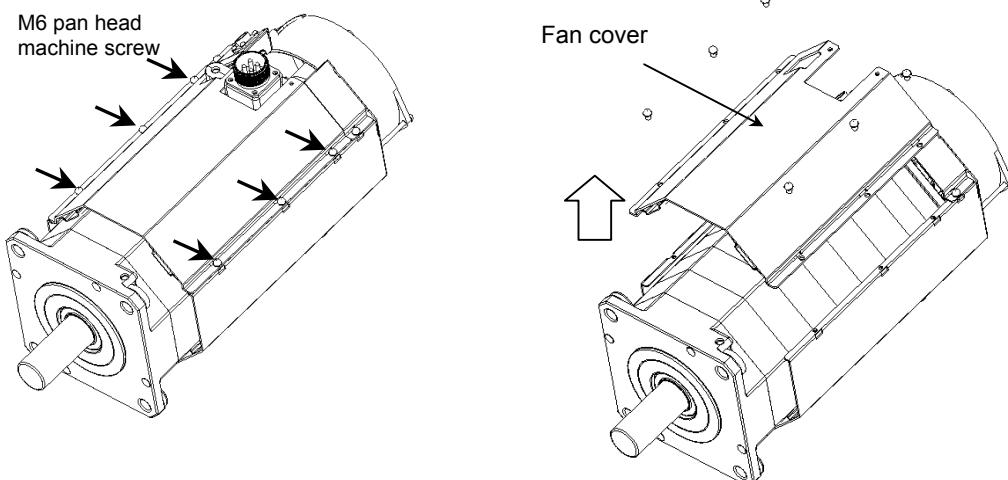

If the load on the fan motor is high or an invalid phase sequence is made for a 3-phase fan motor, the fan motor may overheat and stop. If the power lead is connected, the fan motor suddenly starts rotating when recovered from overheating.

1.2.1 Replacing a Cooling Fan

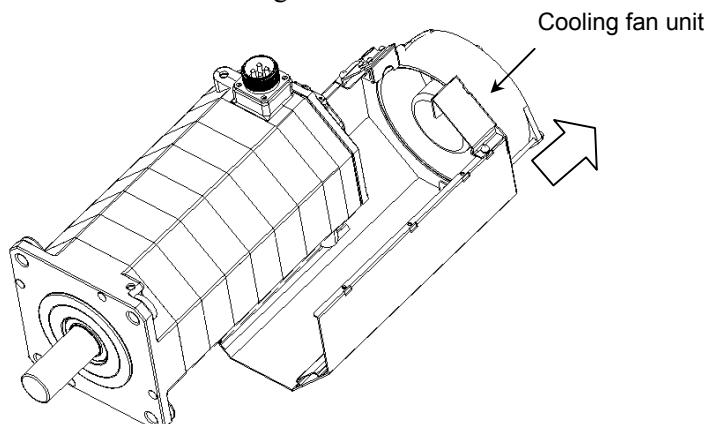

1.2.1.1 αiS 50 with Fan, αiS 60 with Fan, and αiF 40 with Fan

(1) Removing a cooling fan unit

- <1> Remove six M6 pan head machine screws fastening the fan cover and remove the front fan cover. You need only to loosen the pan head machine screws indicated by the arrow in the figure.

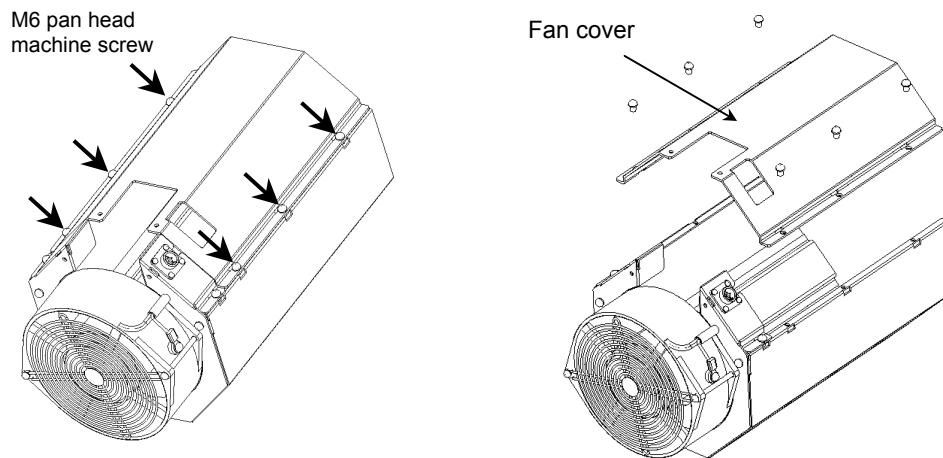

- <2> Remove the cooling fan unit from the motor.

(2) Mounting a cooling fan unit

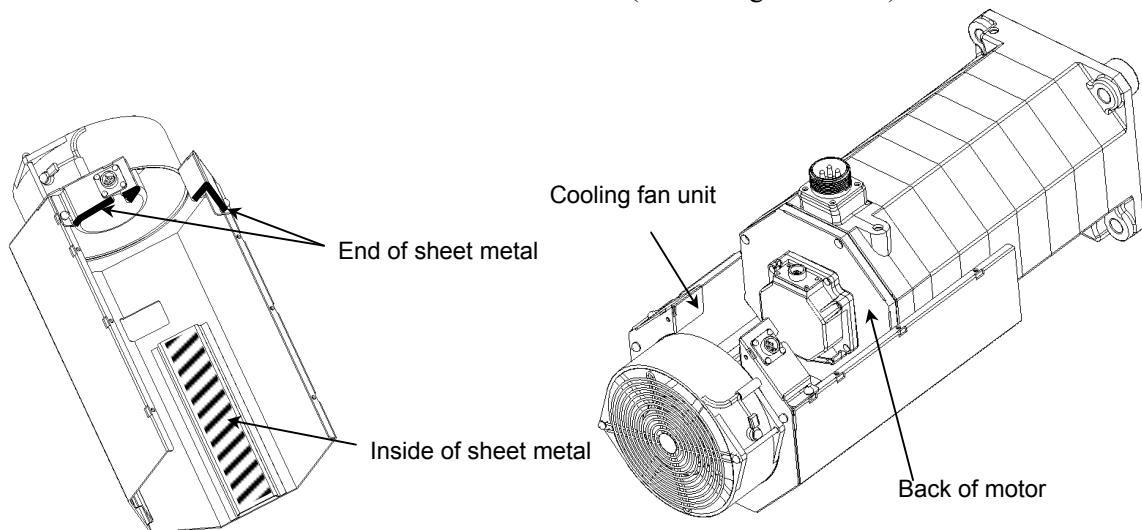

<1> Remove six M6 pan head machine screws from a new cooling fan unit and remove the front fan cover.

You need only to loosen the pan head machine screws indicated by the arrow in the figure.

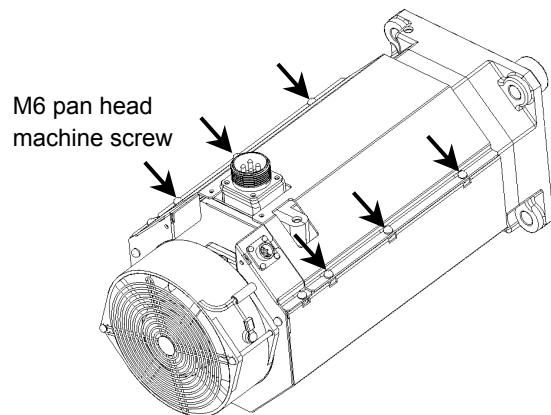

<2> Assemble the cooling fan unit and motor.

Align the inside of the sheet metal of the cooling fan unit with the side of the motor and touch the end of the sheet metal with the back of the motor. (See the figure below.)

<2> Mount the fan cover and tighten the six M6 pan head machine screws.
(Appropriate torque: 2.5 to 2.8 Nm)

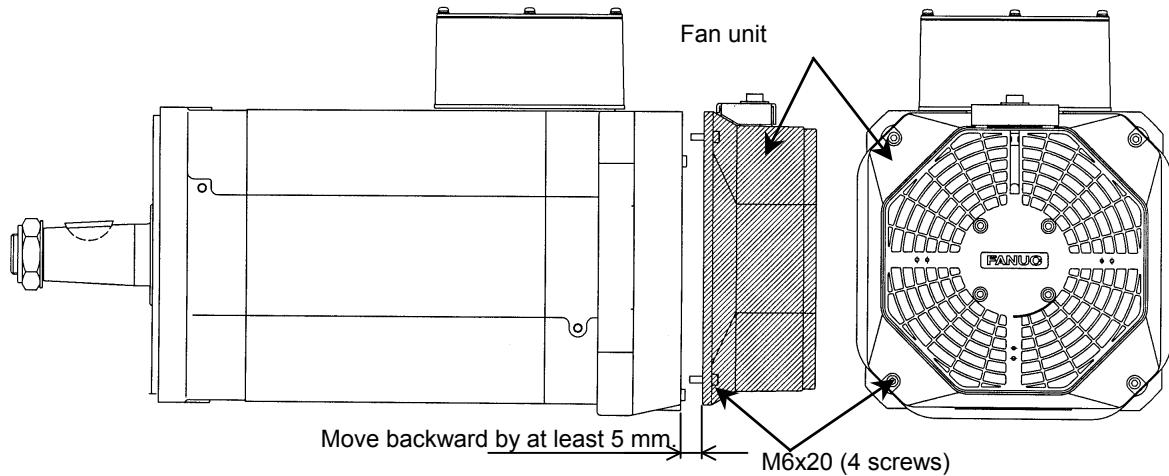

1.2.1.2 **αiS 100 with Fan and αiS 200 with Fan (including HV)**

- (1) Removing a cooling fan unit

Remove the four M6 hexagon socket head cap screws fastening the fan unit and remove the fan unit.

- (2) Mounting a cooling fan unit

Apply adhesive for fastening (moderate strength) to the four M6 hexagon socket head cap screws and mount the fan unit. (Appropriate torque: 3.0 to 3.5 Nm)

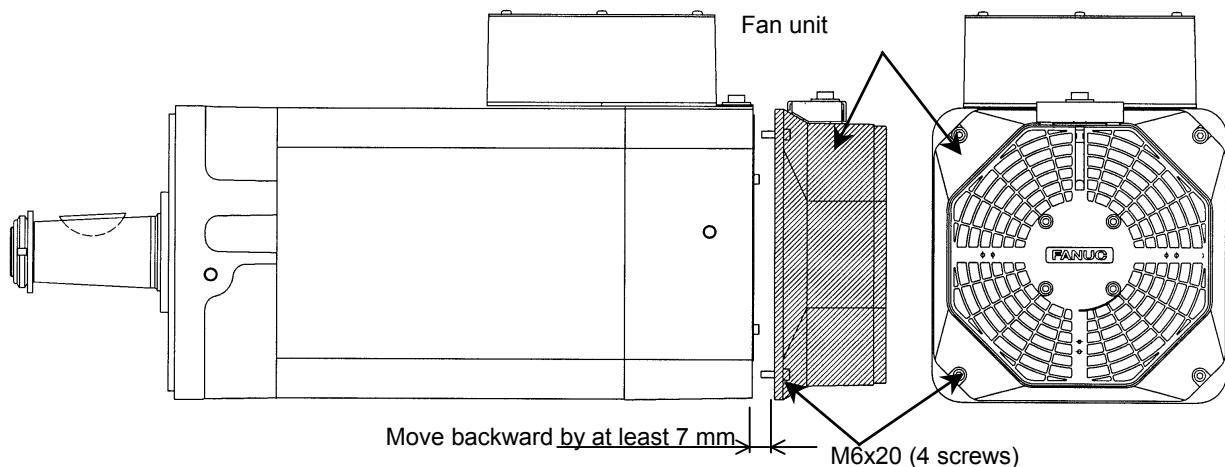

1.2.1.3 **αiS 300 and αiS 500 (including HV)**

- (1) Removing a cooling fan unit

Remove the four M6 hexagon socket head cap screws fastening the fan unit and remove the fan unit.

- (2) Mounting a cooling fan unit

Apply adhesive for fastening (moderate strength) to the four M6 hexagon socket head cap screws and mount the fan unit. (Appropriate torque: 3.0 to 3.5 Nm)

1.2.1.4 **α iS 1000HV**

(1) Removing a cooling fan unit

Remove the four hexagon socket head cap screws fastening the fan unit and remove the fan unit.

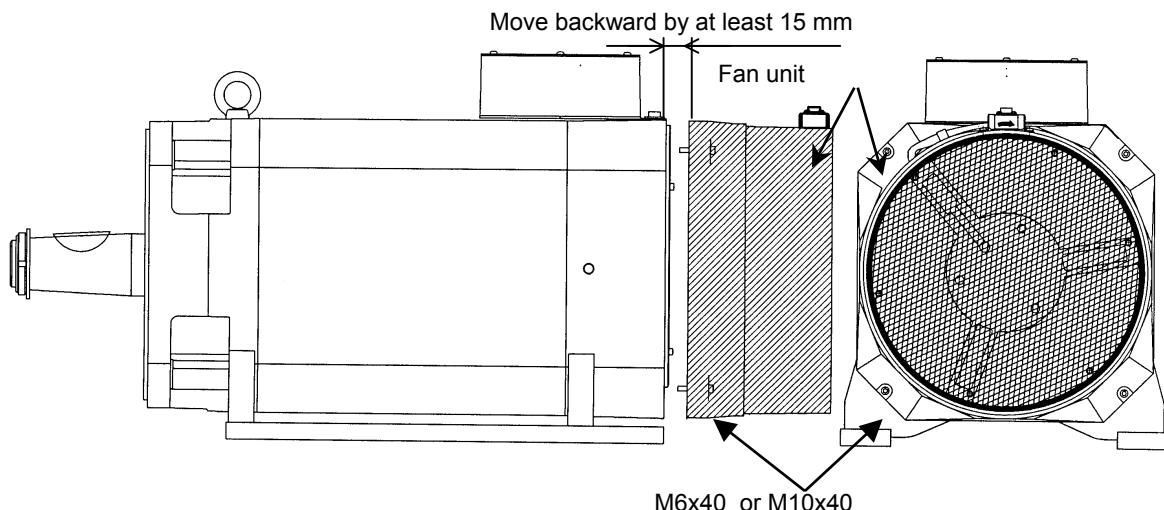

M6x40: 4 screws (A06B-0298-BXXX)

M10x40: 4 screws (A06B-0098-BXXX, A06B-0099-BXXX)

(2) Mounting a cooling fan unit

Apply adhesive for fastening (moderate strength) to the four hexagon socket head cap screws and mount the fan unit.

Appropriate torque: 9.6 to 13Nm (M6), 19 to 26Nm (M10)

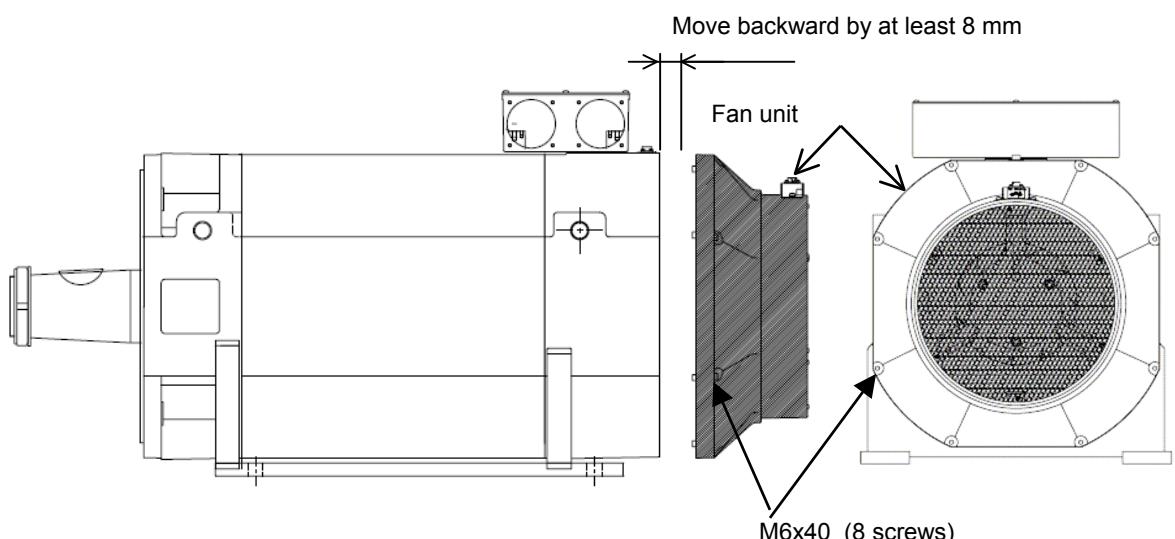

1.2.1.5 **α iS 2000HV and α iS 3000HV**

(1) Removing a cooling fan unit

Remove the eight M6 hexagon socket head cap screws fastening the fan unit and remove the fan unit.

(2) Mounting a cooling fan unit

Apply adhesive for fastening (moderate strength) to the eight M6 hexagon socket head cap screws and mount the fan unit. (Appropriate torque: 9.6 to 13 Nm)

2 SPINDLE MOTOR MAINTENANCE PARTS

2.1 MAINTENANCE PARTS

(1) Parts of the terminal box (αiI , αiI_P , and αCi series 200V type)

Model	Terminal box assembly	Lid of terminal box
αiI 1/10000, αiI 1/15000 αiI 1.5/10000, αiI 1.5/20000 $\alpha C1/6000i$	A290-1402-T400	A290-1402-V410

- 1 These drawing numbers include fan motors.
- 2 The above table may not apply to motors of which motor drawing number ends with B9xx. Contact your FANUC service representative.

APPENDIX

A MEASURING SERVO MOTOR WAVEFORMS (TCMD, VCMD)

To use a servo motor in a good performance condition for a long time and prevent any failure from occurring, the TCMD and VCMD waveforms of the servo motor can be checked as diagnosis.

(1) Observation of torque command (TCMD) and speed command (VCMD) waveforms

Check whether there is no abnormality in the waveforms.

For how to measure the TCMD and VCMD waveforms, refer to the FANUC AC SERVO MOTOR *ai* series Parameter Manual (B-65270EN).

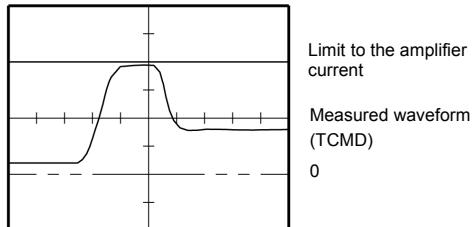

The waveforms vary according to the operating conditions such as load and cutting speed. Note that you should make comparisons under the same condition (for example, during fast traverse to the reference position or low-speed cutting).

(2) Diagnosis by waveforms

Check the measured waveforms to see whether:

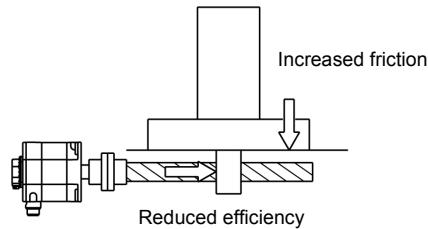

<1> The peak current is within the limit to the current in the amplifier during rapid traverse, acceleration, or deceleration.(TCMD)

The limit to the amplifier current is listed below.

⇒ The motor used to accelerate/decelerate with the amplifier current within the limit (the acceleration/deceleration torque used to be sufficient), but something is wrong now. If this is the case, the probable causes are:

- The load conditions in the machine have changed because of changed friction or reduced machine efficiency after long period of use.
- Motor failure

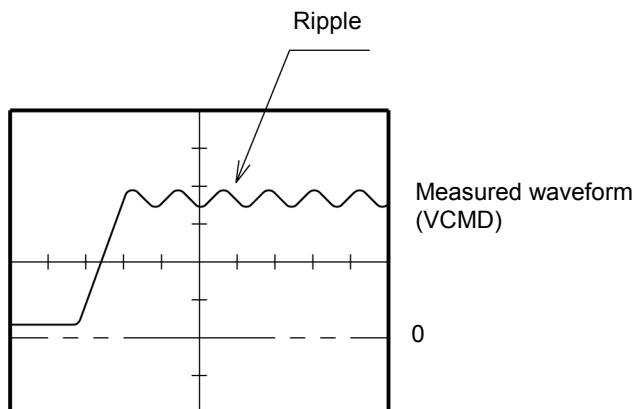

[Table 1]

Models	Current value
$\alpha iS2/5000HV$, $\alpha iS2/6000HV$, $\alpha iS4/5000HV$, $\alpha iS4/6000HV$	10Ap

$\alpha iS300/3000HV$, $\alpha iS500/3000HV$	540Ap
$\alpha iS300/2000$, $\alpha iS500/2000$, $\alpha iS1000/2000HV$	360Ap x 2 (Note)
$\alpha iS1000/3000HV$, $\alpha iS2000/2000HV$, $\alpha iS3000/2000HV$	360Ap x 4 (Note)

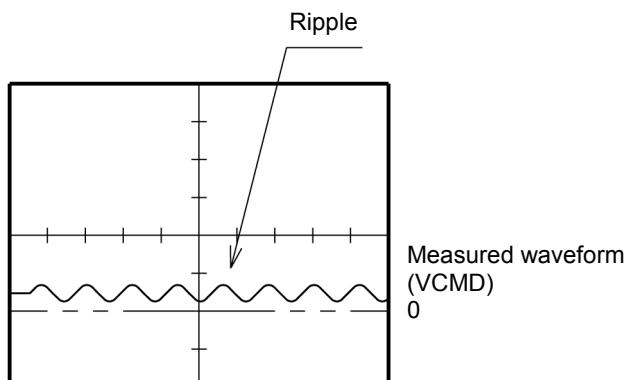

NOTE

More than one Servo Amplifier is used for one motor.

<2> The waveform has ripple during constant-speed feeding (VCMD).

<3> The current waveform has ripple or jumps when the motor is not rotating (VCMD).

If you find anything unusual in relation to the above items <1> to <3>, contact your FANUC service staff.

1.1.6 Check Items

No.	Description	Check method
Servo amplifier installation status check		
1	Servo amplifier and servo motor specifications	Check the combination of the servo amplifier and servo motor referring to Section 4.1 of “ <i>αi</i> series Servo Amplifier Descriptions” (B-65282EN/06).
2	Flange packing	Check the supplied packing is attached properly and that there is no gap between the control panel and amplifier flange.
3	Maintenance area	Please keep a maintenance area for the amplifier. For details, refer to Section 5.1 of the document (B-65282EN/06-18) attached to “ <i>αi</i> series Servo Amplifier Descriptions”.
4	Preventing contact with any current-carrying section	Check a protective plate is attached to the DC link terminal board properly and the terminal board cover is locked. For details, refer to Section 5.3 of the document (B-65282EN/06-18) attached to “ <i>αi</i> series Servo Amplifier Descriptions”.
5	Order of amplifier locations	As for the <i>αiSP45HV</i> or the larger model, there is a rule to place the amplifiers. For details, refer to Section 5.3 of the document (B-65282EN/06-18) attached to “ <i>αi</i> series Servo Amplifier Descriptions”.
6	Prevent cutting fluid intrusion	Take a measure to prevent electroconductive, flammable, and corrosive material as well as mist and water drop from getting in the unit. For the detail of an effective closeness of the control panel, refer to Appendix G of “ <i>αi</i> series Servo Amplifier Descriptions” (B-65282EN/06).
Servo amplifier wiring status check		
7	Tightening terminal board screws	When connecting wires to the servo amplifier terminal board, be sure to tighten the screws with a proper torque. For the detail of the tightening torque for the terminal board screws, refer to Subsection 5.5.2.9 of “ <i>αi</i> series Servo Amplifier Descriptions” (B-65282EN/06).
8	Connecting a protective ground	Use a proper cable for grounding in order to prevent electrical shocks at a ground fault. For details, refer to Subsection 9.3.1.7 of “ <i>αi</i> series Servo Amplifier Descriptions” (B-65282EN/06).
9	Installing a lightning surge protector	In order to prevent damage due to a surge voltage applied to the input power supply, install a lightning surge protector. For details, refer to Appendix A of “ <i>αi</i> series Servo Amplifier Descriptions” (B-65282EN/06).
10	Measure for noise	Check that ground wires, including feedback cable shielding clamps, are connected to proper places to maintain a stable operation of the machine. For details, refer to Section 5.2 of “ <i>αi</i> series Servo Amplifier Descriptions” (B-65282EN/06) and Subsection 7.2.5 of the document (B-65282EN/06-18) attached to “ <i>αi</i> series Servo Amplifier Descriptions”. Also refer to Subsection 7.2.8 if the 24 V power supply is shared between the servo amplifier and the CNC.

(Continued on the next page)

				TITLE	<i>αi</i> series SERVO AMPLIFIER for 30 <i>i</i> -B Start-up and Maintenance manual
					NO. B-65285EN/03-02/01
EDT.	DATE	DESIG.	DESCRIPTION	FANUC CORPORATION	PAGE 11 / 76

(Continued from the previous page)

11	Order of motor power line phases	If the order of motor power line phases is incorrect, there is a risk of an unexpected behavior of motor. So, make sure that the power wires are connected to the motor properly.
12	Checking the axis where motor feedback and power wires are connected	If the axis where motor feedback and power wires are connected is incorrect, there is a risk of an unexpected behavior of motor. So, make sure that the connection is correct.
13	Battery connection	Do not connect the built-in batteries in parallel. Please make sure, if the built-in batteries are used with an amp-to-amp battery connection cable (CXA2A/B or BATL (B3)) attached, they may be connected in parallel. For details, refer to Subsection 9.3.2.10 of “ <i>αi</i> series Servo Amplifier Descriptions” (B-65282EN/06).
Operation start-up check		
14	Power supply voltage check	Before turning power on, check that the power supply voltage is in its proper range. For details of the power supply voltage specification, refer to Section 2.1 of “ <i>αi</i> series Servo Amplifier Descriptions” (B-65282EN/06).
15	Ground potential check	The 400 V servo amplifier supports only neutral grounding. For details, refer to Section 2.1 of “ <i>αi</i> series Servo Amplifier Descriptions” (B-65282EN/06).
16	Ground fault interrupter setting	Use a ground fault interrupter that supports inverters. For explanations about leakage current, refer to Section 5.1 of “ <i>αi</i> series Servo Amplifier Descriptions” (B-65282EN/06).
17	Control power check	Check that the voltage of the 24 V power supply for amplifiers is in its proper range and the selected current capacity is proper. For details, refer to Section 4.5 and Subsection 7.2.8 of the document (B-65282EN/06-18) attached to “ <i>αi</i> series Servo Amplifier Descriptions”.
18	Parameter setting	Set initial parameters while referencing Section 1.2 of this document.
19	Handling early failures	Solve start-up problems, such as being impossible to turn power on, motor failing to rotate, and alarm occurrence, while referencing Section 1.3 of this document.

					12 / 76

1.2. INITIALIZING PARAMETERS

1.2.1 Common Power Supply

The common power supply (PS) for the 30*i*-B series is controlled by software. So, information concerning the power supply can be known on the CNC. Using these informations makes it possible to diagnose failures resulting from power supply fluctuation.

Unlike the servo amplifier (SV) or spindle amplifier (SP), PS cannot communicate directly with CNC. So, the power supply information is transferred through SV or SP to CNC.

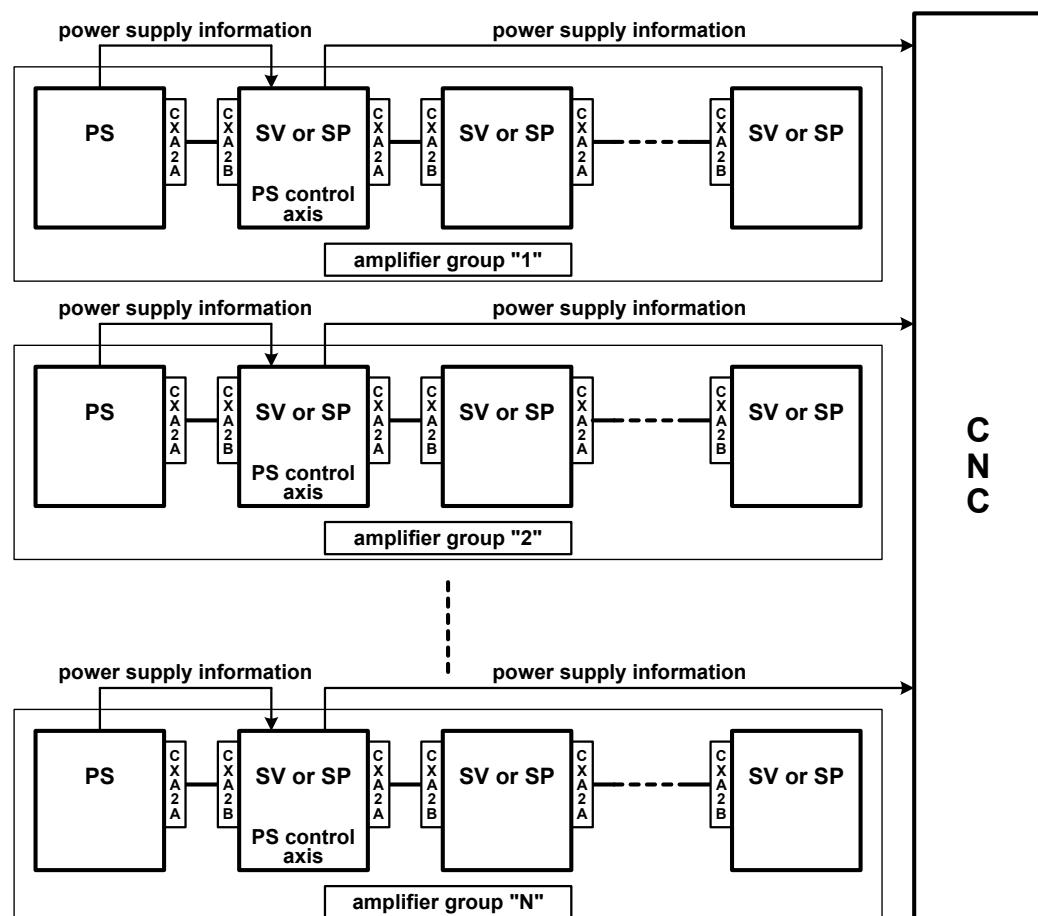

1.2.1.1 Amplifier group number

A group of one PS and the servo and spindle amplifiers connected to the PS is defined as an “amplifier group”. This means that a system having more than one PS has more than one amplifier group. A unique number is assigned to each amplifier group. The unique number is described as “amplifier group number”.

1.2.1.2 PS control axis

The PS is connected to amplifiers via the CXA2x connector. In this connection, let us refer to an axis driven by the servo/spindle amplifier nearest to the PS is described as “PS control axis”.

The power supply information mentioned above is transferred through this PS control axis to the CNC.

				TITLE	<i>oi</i> series SERVO AMPLIFIER for 30 <i>i</i> -B Start-up and Maintenance manual
				NO.	B-65285EN/03-02/01
EDT.	DATE	DESIG.	DESCRIPTION	FANUC CORPORATION	PAGE
					13 / 76

1.2.1.3 Parameter setting for specifying a PS control axis

Using the servo and spindle amplifiers for the 30*i*-B series requires the following procedure.

1.2.1.3a Parameter setting procedure

In order for the CNC software to recognize the PS control axis, it is necessary to set an amplifier group number in either of the following parameters:

Parameter No. 2557 in case the PS control axis is a servo axis

Parameter No. 4657 in case the PS control axis is a spindle axis

This setting can be made automatically with the following procedure.

- (1) Set bit 0 (APS) of parameter No. 11549 to 1.

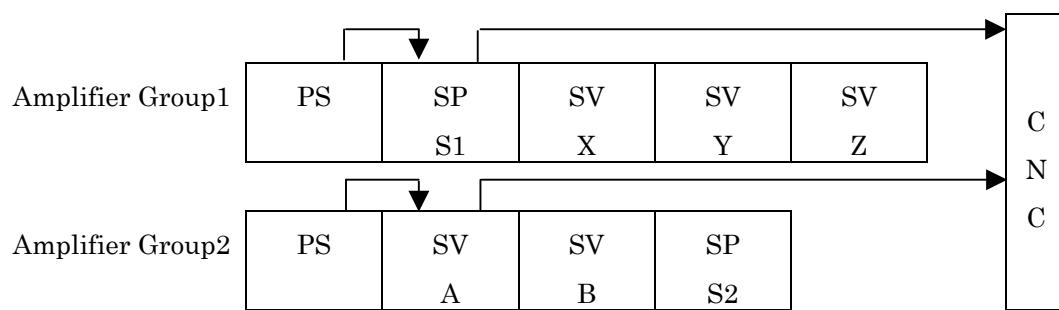

The message “PW0000 POWER MUST BE OFF” appears on the alarm message screen. So turn the CNC power off and on again. Parameters Nos. 2557 and 4657 are automatically set with an amplifier group number, thus completing PS control axis parameter setting.

- * Upon completion of automatic parameter setting, bit 0 of parameter No. 11549 returns to 0.
- * If the amplifier configuration is changed, the alarm “PS CONTROL AXIS ERROR” occurs just after CNC start-up. So, perform automatic parameter setting again.

Related parameter	Description
No.11549#0(APS)	Setting this parameter to 1 causes an amplifier group number to be automatically set in PS control axis parameter No. 2557 or 4657.
No.2557	In case the servo axis is a PS control axis, an amplifier group number is set for the PS control axis.
No.4657	In case the spindle axis is a PS control axis, an amplifier group number is set for the PS control axis.

				TITLE	<i>αi</i> series SERVO AMPLIFIER for 30 <i>i</i> -B Start-up and Maintenance manual
				NO.	B-65285EN/03-02/01

					15 / 76

1.2.2 Servo Amplifiers

1.2.2.1 Servo parameter initialization procedure

The initialization procedure for servo amplifiers and servo motors is described below. For details of each item of the procedure, refer to “FANUC AC SERVO MOTOR αi series/FANUC AC SERVO MOTOR βi series/FANUC LINEAR $L iS$ series/FANUC BUILT-IN SERVO MOTOR $D iS$ series Parameter Manual” (B-65270).

				TITLE	αi series SERVO AMPLIFIER for 30 <i>i</i> -B Start-up and Maintenance manual
					NO. B-65285EN/03-02/01
EDT.	DATE	DESIG.	DESCRIPTION	FANUC CORPORATION	PAGE 16 / 76

1.2.2.2 Multi-axis amplifier start-up

The conventional multi-axis amplifier cannot become ready unless the start-up conditions for all axes are satisfied. However, the multi-axis servo amplifier for the 30i-B series can become ready for individual axes separately if the start-up conditions for them are satisfied.

Multi-axis amplifier ready status indicator

The 7-segment LED indicator on the multi-axis servo amplifier for the 30i-B series can indicate “0.” (dotted zero) meaning a ready status for some axes and a not-ready status for others as well as “0” meaning a ready status for all axes and “-” meaning a not-ready status for all axes.

7-segment LED indicator	Amplifier status	Description
-	Not ready (for all axes)	Not ready for all axes (same as conventional) All axes are braked dynamically and inoperable.
0	Ready (for all axes)	Ready for all axes (same as conventional) All axes are operable.
0.	Ready (except for some axes)	Ready for some axes and not ready for others. This indication differs from the all-axis ready status indication in that the dot lights. Only the axes for which the amplifier is ready are operable. The axes for which the amplifier is not ready are braked dynamically.

- **Multi-axis amplifier behavior at alarm occurrence**

If the former multi-axis servo amplifier detects an alarm even on one axis, it becomes Not ready for all axes regardless of what the alarm is like and applies a dynamic brake to all the axes to bring them to halt. If the multi-axis servo amplifier for the 30i-B series detects an individual-axis alarm (such as an IPM alarm) on any axis, however, it becomes Not ready only for that axis and stays ready for the other axes in the servo amplifier.

- **No restriction on the multi-axis amplifier at alarm occurrence**

Even if an alarm occurs on the brake control function, quick stop function, or the Gravity-axis drop prevention function at an emergency stop for any axis, unlike the former multi-axis servo amplifier, there is no restriction on the multi-axis servo amplifier for the 30i-B series regarding any application using the operation of the other axes.

				TITLE	<i>αi</i> series SERVO AMPLIFIER for 30 <i>i</i> -B Start-up and Maintenance manual	
					NO.	B-65285EN/03-02/01

				17 / 76		

[Behavior of axes (normal axes) at alarm occurrence on any other axis]

	Alarm	Behavior of normal axes	
		Conventional servo amplifier	Servo amplifier for the 30i-B series
<1>	Alarm (such as excessive-error alarm) detected by the servo or CNC software	Possible to delay the ready status of the servo amplifier.*	Possible to delay the ready status of the servo amplifier.*
<2>	Individual-axis alarm detected by the servo amplifier <1> Abnormal Motor current <2> IPM alarm <3> DB relay abnormal alarm	Possible to delay the ready status of the servo amplifier only for the one-axis amplifier.* (Impossible to delay the ready status of the servo amplifier if a multi-axis amplifier detects an alarm for axes of the same amplifier.)	Possible to delay the ready status of the servo amplifier for all amplifiers.*
<3>	Alarms other than <1> or <2> above	Becomes Not ready instantly.	Becomes Not ready instantly.

*It is possible to pull up normal vertical axes while the ready status of the servo amplifier is being delayed.

				TITLE	<i>αi</i> series SERVO AMPLIFIER for 30 <i>i</i> -B Start-up and Maintenance manual	
					NO.	B-65285EN/03-02/01
EDT.	DATE	DESIG.	DESCRIPTION	FANUC CORPORATION		PAGE
18 / 76						

- **Supporting the axis detach function for multi-axis amplifiers**

Conventionally, the axis detach function has been applicable only to axes driven by a one-axis servo amplifier. Now, the detach function is applicable to each axis driven by the multi-axis servo amplifier for the 30i-B series.

- **Setting dummy axes for multi-axis amplifiers**

Starting up a specific axis on the conventional multi-axis amplifier requires attaching a dummy connector to the axes not in use. With the servo amplifier for the 30i-B series, it is possible to start up only arbitrary axes. So, it is unnecessary to attach a dummy connector to any axis not in use.

- **Sharing a multi-axis amplifier with two or more paths**

If the conventional multi-axis amplifier is shared among multiple paths, it is necessary to input a signal for ignoring the VRDY-OFF alarm when the amplifier becomes Not ready for an axis being used by one path, so that it will not become Not ready for axes in use by the other paths. For the servo amplifier for the 30i-B series, it is unnecessary to input such a signal.

CAUTION**1. Note on synchronization control and tandem control**

If an alarm occurs on one of the axes used on a multi-axis amplifier under synchronization or tandem control, it is necessary for the multi-axis amplifier to become Not ready immediately also for the other axes in order to prevent machine distortion. To meet this requirement, be sure to enable the servo software's "servo alarm 2-axis simultaneous monitoring function" for axes under synchronization or tandem control.

In some cases, implementing synchronization or tandem control for two axes driven by the conventional multi-axis amplifier caused the amplifier to become Not ready for the two axes simultaneously at alarm occurrence as if the "servo alarm 2-axis simultaneous monitoring function" had operated.

Because the ready status conditions of the multi-axis amplifier for the 30i-B series for each axis are independent of one another, using the multi-axis amplifier does not work in place of the "servo alarm 2-axis simultaneous monitoring function". For this reason, be sure to enable the "servo alarm 2-axis simultaneous monitoring function" for axes under synchronization or tandem control also when the multi-axis amplifier is used. Refer to "Parameter Manual" for detailed descriptions of the "servo alarm 2-axis simultaneous monitoring function" and the related parameter setting.

2. If an alarm (such as a DC link low-voltage alarm) common to all axes occurs, any axis driven by the multi-axis amplifier can be the cause of the alarm in the same manner as with the conventional amplifier, resulting in the amplifier becoming Not ready simultaneously for all axes and a dynamic brake being applied to all axes to bring them to halt.
3. If an emergency stop signal (input signal to the connector CX4 of the PS) is input, the amplifier becomes Not ready for all axes and applies a dynamic brake to all axes to bring them to halt.

1.2.3 SPINDLE AMPLIFIER

1.2.3.1 PARAMETER FOR SPINDLE SERIAL OUTPUT

Only the list of parameters for SPINDLE SERIAL OUTPUT is mentioned.

As for the detail of these parameter, refer to 11.2 "SPINDLE SERIAL OUTPUT" of FANUC Series 30i / 31i / 32i -MODEL B CONNECTION MANUAL (FUNCTION)

Parameter number	Description
30i-B	
3716#0	(Analog/Serial) Selection of Spindle (Set to "1")
3702#1	The multi-spindle control function (The multi-spindle control function is used /not used)
3717	The spindle amplifier number of each spindle
3718	Subscript for display of spindle (main spindle)
3719	Subscript for display of spindle (sub-spindle)

Note

When a serial spindle is used, the option for spindle serial output is required.

About FSSB Setting,

refer to 1.4.4 「FSSB Setting」 of FANUC Series 30i / 31i / 32i -MODEL B CONNECTION MANUAL (FUNCTION).

1.2.3.2 Automatic Spindle Parameter Initialization

An automatic setup of spindle parameters (No.4000-No.4799) is described as follow.

Note

When you do not want to initialize the adjusted parameters,
don't perform automatic spindle parameter initialization.

1.2.3.2a Parameter List

Parameter No.	Description
30i-B	
4019#7	Function for automatically initializing spindle parameters.
4133	Spindle motor model code

				TITLE	<i>αi</i> series SERVO AMPLIFIER for 30i-B Start-up and Maintenance manual
				NO.	B-65285EN/03-02/01
EDT.	DATE	DESIG.	DESCRIPTION	FANUC CORPORATION	PAGE
					20 / 76

1.2.3.2b Procedure for automatic spindle parameter initialization

Perform automatic spindle parameter initialization by following the procedure below.

<1> Set the model code for the desired motor for automatic parameter initialization.

Parameter No.	Description
30i-B	
4133	Model code

Note

- 1 The control method usable with the αi series spindle is spindleHRV control only. The conventional control method is not supported.
- 2 About the model code of each motor, refer to FANUC AC SPINDLE MOTOR αi series PARAMETER MANUAL B-65280JA.
- 3 When using a spindle motor that has no model code, set model code “300” (“400” for a spindle motor with speed range switching control) for automatic parameter setting, then manually input data according to the parameter table for each motor model.

<2> Set the relevant parameter to enable automatic spindle parameter initialization.

Parameter No.	Description
30i-B	
4019#7	1

Note

This bit is reset to its original value after automatic parameter initialization.

<3> Turn the CNC off, then on again. Then, the spindle parameters specified with a model code are automatically initialized.

				TITLE	αi series SERVO AMPLIFIER for 30i-B Start-up and Maintenance manual

1.3. Troubleshooting at Start-up

1.3.1 Power supply

(1) The LED on power supply is off

When the LED on power supply does not become on after the main circuit breaker is turned on.

No.	Cause of trouble	Check method	Action
1	The 24V control power is not supplied.	Check the voltage of the external power supply (24V).	Check whether the external power supply is faulty.
2	The cable is defective.	Check whether the cable attached to the connector CXA2A/B is disconnected or short-circuited.	Check the cable attached to the connector CXA2A/B.
3	The power is externally connected to 0 V, GND, or the like.	Check whether the cable for 24V power is short-circuited	Replace or repair the cable.
4	There is a blown fuse on the printed circuit board.	Check whether the fuse on the printed circuit board for the control has blown. See Chapter 4.2 about the location of the fuse.	If the fuse blows, the printed circuit board may be faulty. Replace the unit.
5	The printed circuit board is defective.	If the cause is not No.1 - 4, the printed circuit board of servo amplifier may be faulty.	Replace the unit.

				TITLE	<i>αi</i> series SERVO AMPLIFIER for 30 <i>i</i> -B Start-up and Maintenance manual
				NO.	B-65285EN/03-02/01

					22 / 76

1.3.2 Servo amplifier

(1)The LED on servo amplifier is off

When the LED on servo amplifier does not become on after the main circuit breaker is turned on.

No.	Cause of trouble	Check method	Action
1	The 24V control power supply is not supplied	Check the voltage of the 24V power supply	Check the 24V power supply
2	The cable is defective	Checke that the cable connected the CXA2A/2B is disconnnected or short	Checke the cable connected the CXA2A/2B
		Check whether 5V power supply short-circuits by the feedback cable.	Checke the feedback cable
3	The power supply is short-circuited externally.	Please check whether the power cable is short-circuited.	Exchange or repair the cable.
4	Blown fuse in the control circuit	Check the fuse on the control PCB (Reffer to 4.2 about position of fuse)	Since Control PCB may be out of order when this fuse is blown, please exchange the unit.
5	The PCB of servo amplifier is defective	If it does not correspond to No.1~4, the PCB of servo amplifier may be defective.	Exchange the servo amplifier

					23 / 76

(2) VRDY-OFF alarm is indicated on the CNC screen.

When the VRDY-OFF alarm is indicated on the NC, check the items listed below.

In addition, VRDY-OFF can occur also for reasons other than listed below. If all of the following items turn out to have not caused VRDY-OFF, check diagnosis information No.358 (V ready-off information) on the diagnosis screen and report it to FANUC.

(1) Communication between amplifiers

Is the cable for the communication interface (CXA2A/B) between the amplifiers connected correctly?

(2) Emergency stop signal (ESP)

Has the emergency stop signal (connector: CX4) applied to the common power supply been released? Alternatively, is the signal connected correctly?

(3) MCON signal

Hasn't setting up the axis detach function disabled the transmission of the ready command signal MCON from the NC to the servo amplifier?

(4) Servo amplifier control board

The servo amplifier control board may be poorly installed or faulty. Be sure to push the face plate as far as it will go. If the problem persists, replace the control board.

On the Series 30i /31i /32i, checking diagnosis information (DGN) No.358 makes it possible to analyze the cause of the VRDY-OFF alarm.

Diagnosis

358

V ready-off information

Convert the displayed value to binary form, and check bits 5 to 14 of the resulting binary number.

When the servo amplifier starts working, these bits become 1 sequentially, starting at bit 5. When the servo amplifier has started normally, all of bits 5 to 14 become 1.

Check bits 5 to 14 sequentially, starting at the lowest-order bit. The first lowest bit that is 0 corresponds to the processing that caused the V ready-off alarm.

EDT.	DATE	DESIG.	DESCRIPTION	FANUC CORPORATION		PAGE
						24 / 76

The following table lists the values of diagnosis information No.358 and the major failure causes. Do not detach or attach any connector while the power is on.

Values of diagnosis information No.358	Description of failures	Check items
417	Emergency stop has not been released.	(1) Check that an emergency stop signal applied to CX4 of the common power supply has been released. (2) Check that there is no anomaly on the connection for communication between the amplifiers or the related cable. (3) Replace the servo amplifier.
993	No PS ready signal (CRDY) is output.	(1) Check that there is no problem with the connection for communication (CXA2A/B) between the amplifiers or the related cable. (2) Check that the input power is supplied. (3) Check that the operation coil of the magnetic contactor is supplied with power and that there is no problem with the connection of CX3 of the common power supply. (4) Replace the servo amplifier.
4065	No interlock signal is input.	If the dynamic brake module (DBM) is in use, make checks (1) to (4). If not, replace the servo amplifier. (1) Check the connection between the servo amplifier and DBM. (2) Check the connection (CX1A/B) between the common power supply and servo amplifier. (3) Check that the fuse (FU2) on the common power supply control board has not blown. (4) Replace the servo amplifier.
225	—	Replace the servo amplifier.
481	—	Replace the servo amplifier.
2017	—	Replace the servo amplifier.
8161	—	Replace the servo amplifier.
97	—	Check that the axis detach function has not been set.

1.3.3 SPINDLE AMPLIFIER

(1) The PIL LED (power-on indicator) is off.

- (1) When the PIL LED on the spindle amplifier module does not become on after the main circuit breaker is turned on.

No.	Cause of trouble	Check method	Action
1	The 24V control power is not supplied.	The PS PIL lamp is off.	Check the cable attached to CX1D of PS.
2	The cable is defective.	The PS PIL lamp is on.	Check the cable attached to the connector CXA2A/B.
3	The power is externally connected to 0 V, GND, or the like.	When the connector is detached, the PIL lamp is on.	Replace or repair the cable.
4	There is a blown fuse on the printed circuit board.	Even when all cables except the cable attached to connector CXA2A/B are detached, the PIL lamp does not come on.	If the fuse blows, the printed circuit board may be faulty. Replace the unit.
5	The printed circuit board is defective.		Replace the unit.

(2) The STATUS display is blinking with "--."

- (1) When no spindle communication alarm message is indicated on the CNC
Check whether the CNC software option setting or bit setting is correct.
- (2) When a communication alarm message is indicated on the CNC

No.	Cause of trouble	Check method	Action
1	The cable is defective.	Check the connector housing section.	Repair or replace the cable.
2	The printed circuit board is defective.		Replace the unit.

				TITLE	<i>αi</i> series SERVO AMPLIFIER for 30 <i>i</i> -B Start-up and Maintenance manual	
					NO.	B-65285EN/03-02/01
EDT.	DATE	DESIG.	DESCRIPTION	FANUC CORPORATION		PAGE
				26 / 76		

(3) The motor does not turn.

- (1) When "--" is indicated on the STATUS display of the SP

Check whether spindle control signals are input. (An example for the first spindle is shown below.)

FS30 <i>i</i>	#7	#6	#5	#4	#3	#2	#1	#0
G070	MRDYA		SFRA	SRVA				
G071							*ESPA	
G029		*SSTP						
G030	SOV7	SOV6	SOV5	SOV4	SOV3	SOV2	SOV1	SOV0

- (2) When "00" is indicated on the STATUS display of the SP

No spindle speed command is input.

Refer to Chapter 1 in "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)," and check related parameters.

- (3) When an alarm number is indicated on the SP

See the description of the alarm number in Part II.

(4) A specified speed cannot be obtained.

- (1) When the speed always differs from a specified speed

Check parameters.

Refer to Chapter 1 in "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)," and check related parameters.

- (2) When an alarm number is indicated on the SP

See the description of the alarm number in Part II.

(5) When cutting is not performed, the spindle vibrates, making noise.

- (1) The spindle vibrates only when the spindle speed has reached or is at a particular speed level.

Check whether the spindle also vibrates when the motor is turning by inertia. If noise is unchanged, investigate the source of mechanical vibration. There are several methods to turn the spindle by inertia as explained below. Because these methods involve machine sequences, consult with the machine tool builder.

A. Setting spindle control signal MPOF (FS30*i*-B: G73#2) to 1 immediately causes the spindle to turn by inertia.

B. Set ALSP (FS30*i*-B: bit 2 of parameter No. 4009) to 1. Then, when the power to the CNC is turned off during spindle rotation, the spindle turns by inertia. (On the spindle amplifier, Alarm 24 is indicated.)

- (2) When noise is generated at the time the motor is stopped or at any time

A. See Subsection 4.3.4 of this part, and check and adjust the waveform of the spindle sensor.

B. Check that the motor part number matches its parameters. For details, refer to Appendix A in "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)."

C. Adjust the velocity loop gain and so forth.

For details, refer to Chapter 1 in "FANUC AC SPINDLE MOTOR *ai* series Parameter Manual (B-65280EN)."

				TITLE	<i>ai</i> series SERVO AMPLIFIER for 30 <i>i</i> -B Start-up and Maintenance manual	
					NO.	B-65285EN/03-02/01
EDT.	DATE	DESIG.	DESCRIPTION	FANUC CORPORATION		PAGE
						27 / 76

(6) An overshoot or hunting occurs.

Refer to Chapter 1 in "FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN)," and adjust parameters.

(7) Cutting power weakens or acceleration/deceleration slows down.

(1) When the load meter does not indicate the maximum output

A. A mechanical cause such as a belt slip may occur.

(2) When the load meter indicates the maximum output

A. Check whether the torque limit signal is input incorrectly.

FS30i	#7	#6	#5	#4	#3	#2	#1	#0
G070							TLMHA	TMLMA

B. If you are using the αi BZ sensor, it is likely that a slip has occurred between the sensor gear and spindle (on acceleration).

C. Check that the motor part number matches its parameters.

For details, refer to Appendix A in "FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN)."

D. Check whether the output limit pattern is set incorrectly.

For details, refer to Chapter 1 in "FANUC AC SPINDLE MOTOR αi series Parameter Manual (B-65280EN)."

(8) Status Error Indication Function

When a parameter is set incorrectly or a sequence is incorrect, the error LED (orange) on the indicator of the spindle amplifier (SP) is turned on, and an error code is displayed.

Ex. Display of error indicator

Status	Indicator
Error display	 error LED and error code

The error is also displayed on the diagnosis screen of the CNC.

Diagnostic number	Content
FS30 <i>i</i>	
710	State error number

When the spindle amplifier module does not operate for a certain function, check whether the status error is indicated in the display section of the SP or the diagnosis screen of the CNC.

No.	Description	Action
01	Although neither *ESP (emergency stop signal) (there are two types of signals, a PMC signal and PSM contact signal) nor MRDY (machine ready signal) has been input, SFR (forward rotation signal), SRV (reverse rotation signal), or ORCM (orientation command) is input.	Check the *ESP and MRDY sequences. For MRDY, pay attention to the parameter that specifies whether to use the MRDY signal (bit 0 of parameter No. 4001).
03	Although parameter settings are such that there is no position sensor (position control is not to be performed, that is, bits 3, 2, 1, and 0 of parameter No. 4002 are, respectively, 0, 0, 0, and 0), a Cs axis contour control command has been issued. In this case, the motor is not activated.	Check setting of the parameter.
04	Although parameter settings are such that there is no position sensor (position control is not to be performed, that is, bits 3, 2, 1, and 0 of parameter No. 4002 are, respectively, 0, 0, 0, and 0), a servo mode (such as rigid tapping or Cs axis control) command or spindle synchronization control command has been issued. In this case, the motor is not activated.	Check setting of the parameter.
05	Although optional parameter for the orientation function is not set, an ORCM (orientation command) is input.	Check setting of the parameter for orientation.

				TITLE	<i>αi</i> series SERVO AMPLIFIER for 30 <i>i</i> -B Start-up and Maintenance manual	
					NO.	B-65285EN/03-02/01
EDT.	DATE	DESIG.	DESCRIPTION	FANUC CORPORATION		PAGE
						29 / 76

No.	Description	Action
06	Although optional parameter for the output switching option is not set, low-speed winding is selected (RCH = 1).	Check setting of the parameter for output switching and the power line status signal (RCH).
07	Although Cs contour control mode is input, neither SFR (forward rotation signal) nor SRV (reverse rotation signal) is input.	Check the sequence.
08	Although servo mode (rigid tapping or spindle positioning) control command is input, neither SFR (forward rotation signal) nor SRV (reverse rotation signal) is input.	Check the sequence.
09	Although spindle synchronization control command is input, neither SFR (forward rotation signal) nor SRV (reverse rotation signal) is input.	Check the sequence.
10	Although Cs contour control command is input, another operation mode (servo mode, spindle synchronization, or orientation) is specified.	Do not specify another mode during execution of the Cs contour control command. Before entering another mode, cancel the Cs contour control command.
11	Although servo mode (rigid tapping or spindle positioning) is input, another operation mode (Cs contour control, spindle synchronization, or orientation) is specified.	Do not specify another mode during execution of the servo mode command. Before entering another mode, cancel servo mode.
12	Although spindle synchronization is input, another operation mode (Cs contour control, servo mode, or orientation) is specified.	Do not specify another mode during execution of the spindle synchronization command. Before entering another mode, cancel the spindle synchronization command.
13	Although orientation specification is input, another operation mode (Cs contour control, servo mode, or synchronization control) is specified.	Do not specify another mode during execution of the spindle synchronization command. Before entering another mode, cancel the spindle synchronization command.
14	The SFR (forward rotation signal) and SRV (reverse rotation signal) are input at the same time.	Input one of the SFR and SRV signals.
16	Although the parameter not to use the differential speed control function (bit 5 of parameter No. 4000 = 0) is set, DEFMD (differential speed mode command) is input.	Check the setting of the parameter and the differential speed mode command
17	The parameter settings for the speed detector (bits 2, 1, and 0 of parameter No. 4011) are invalid. There is no speed detector that matches the settings.	Check the setting of the parameter.

				TITLE	<i>αi</i> series SERVO AMPLIFIER for 30 <i>i</i> -B Start-up and Maintenance manual	
					NO.	B-65285EN/03-02/01
EDT.	DATE	DESIG.	DESCRIPTION	FANUC CORPORATION		PAGE
		30 / 76				

No.	Description	Action
18	Although parameter settings are such that there is no position sensor (position control is not to be performed, that is, "bits 3, 2, 1, and 0 of parameter No. 4002 are, respectively, 0, 0, 0, and 0," a position coder-based orientation command has been issued.	Check the setting of the parameter and the input signal.
19	Although magnetic sensor orientation command is input, another operation mode (Cs contour control, servo mode, or spindle synchronization) is specified.	Do not specify another mode during execution of the orientation command. Before entering another mode, cancel the orientation command.
21	A tandem operation command was input when spindle synchronous control is enabled.	Input a tandem operation command after canceling spindle synchronous control.
22	Spindle synchronous control was specified when tandem operation is enabled.	Specify spindle synchronous control after canceling torque tandem operation.
23	A tandem operation command is input even if the option is not specified.	Torque tandem control requires the CNC software option. Check the option.
24	Although continuous indexing in position coder-based orientation is to be performed, an absolute position command (INCMD = 0) has been issued after incremental operation (INCMD = 1).	Check the INCMD (incremental command). Be sure to perform absolute position command-based orientation before an absolute position command.
26	Parameter settings are made to use both spindle switching and three stage speed range switching control.	Check the parameter settings and input signals.
29	Parameter settings are such that the shortest-time orientation function is to be used (bit 6 of parameter No. 4018 is 0 and parameter Nos. 4320 to 4323 are nonzero).	The shortest-time orientation function cannot be used in the αi series spindle amplifier. Use a different type of orientation.
30	The magnetic pole undetected state is set, but a command is input.	In the magnetic pole undetected state (EPFIXA=0), the motor cannot be driven even if a command is input. Input a command in the magnetic pole detection completed state (EPFIXA=1). While EPFSTR=1 is set, a command is ignored even in the magnetic pole detection completed state, and this error is indicated. Upon completion of magnetic pole detection, set EPFSTR=0.
31	This hardware configuration does not support the use of the spindle FAD function. In this case, the motor is not activated.	Check the CNC model.
32	Although S0 is not specified for the speed mode, the parameter setting is made to enable the disturbance input function (bit 7 of parameter No.4395 =1).	Specify S0 for the speed mode before enabling the disturbance input function (setting bit 7 of parameter No.4395 to 1).

				TITLE	αi series SERVO AMPLIFIER for 30 <i>i</i> -B Start-up and Maintenance manual	
					NO.	B-65285EN/03-02/01
EDT.	DATE	DESIG.	DESCRIPTION	FANUC CORPORATION		PAGE
		31 / 76				

No.	Description	Action
33	This hardware configuration does not support the use of the spindle EGB function. In this case, the motor is not activated.	Check the CNC model.
34	Both spindle FAD function and spindle EGB function are enabled. In this case, the motor is not activated.	These functions cannot be used at the same time. Enable only one of the functions
35	ID information of the spindle amplifier cannot be obtained.	Replace the spindle amplifier with one for which correct ID information is written
36	The SSM is abnormal. (1) The interface signal between the spindle amplifier(SP) and SSM is disconnect. (2) The SSM is faulty.	For action to be taken for this error, see Section 1.4."SUB MODULE SM", in Part IV in FANUC AC SPINDLE MOTOR <i>αi</i> series PARAMETER MANUAL B-65280JA.
37	The current loop setting (parameter No.4012) is changed.	Check the setting of parameter No.4012, and turn the power off, then on again.
38	-Parameters related to inter-spindle amplifier communication are not set correctly. -Functions that cannot be used together with the torque tandem function are set.	Check the parameters.
39	DSCN(disconnection detection disable signal) is input in the state where SFR (forward rotation command), SRV (reverse rotation command), or ORCM (orientation command) is input.	Check the sequence. Do not input DSCN(disconnection detection disable signal) while a command for motor activation is input.
43	A setting unavailable with the <i>αiCZ</i> sensor (serial) is made.(*1)	Check the parameters.
44	The spindle amplifier does not support the control frequency setting.	Check the setting of parameter No.4012.

2. TROUBLESHOOTING

2.1. TROUBLESHOOTING PROCEDURES

2.1.1 Troubleshooting Procedure

Smart trouble shooting function is available for the combination of the 30*i*-B series CNC and the *αi* servo amplifier for the 30*i*-B series. The function analyzes causes of alarm occurrence and shows how to remove them. At alarm occurrence, switch from the CNC screen to the “Trouble diagnosis guidance” screen and remove the cause of the alarm according to what is displayed on the screen.

- ⇒ 2.2 SMART TROUBLE SHOOTING FUNCTION
- ⇒ 2.2.1 Failure Diagnosis Guidance

IMPORTANT

- Using the failure diagnosis guidance requires keeping it in the “SAMPLING” status. See Subsection 2.2.3 for explanations about how to shift to the “SAMPLING” status.

Data (about power supply, motor current, and detector) related to servo amplifiers before alarm and just at alarm are sent to the CNC immediately. This data can be used in taking action for alarm occurrence.

Data (about power supply, motor current, and detector) related to servo amplifiers is saved to the CNC immediately before and at alarm occurrence. This data can be used in taking action for alarm occurrence.

- ⇒ 2.2.2 Failure Diagnosis Monitor

IMPORTANT

- The failure diagnosis monitor has two status, “SAMPLING” and “LATCHED”. If you want to monitor data at future alarm occurrence, perform “CLEAR”. If you want to save the conditions at past alarm occurrence, do not perform “CLEAR”. See Subsection 2.2.3 for detailed descriptions of this procedure.

See Section 2.3 for lists of CNC alarm numbers related to servos and LED indication numbers on servo amplifiers.

NOTE

- There might be a possibility that you cannot get exact analysis even when you use smart trouble shooting function. In such case, identify the alarm number, the program where the alarm occur, and what you operated, and then make a service call.

2.2. SMART TROUBLE SHOOTING FUNCTION

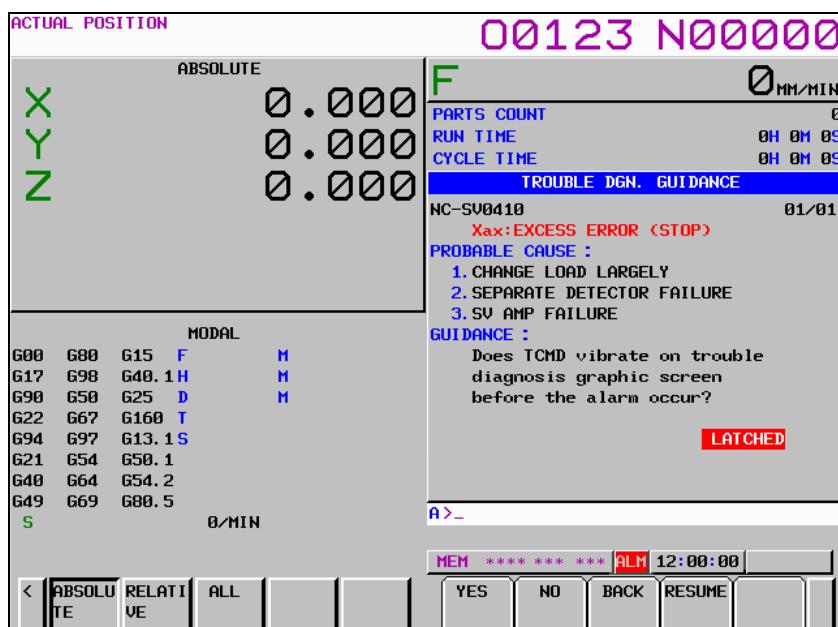

The 30*i*-B series CNC has a function for failure diagnosis. With this function, the operator can get diagnostic information that may be useful to make decisions at the occurrence of a servo, spindle, or CNC alarm from the CNC screen.

The major features of the smart trouble shooting function are as follows:

- “Trouble diagnosis guidance” screen for figuring out alarm causes according to the failure diagnosis flow
- “Trouble diagnosis monitor” screen for monitoring the states of servo circuits and spindles during normal operation and enabling data to be latched at alarm occurrence
- “Trouble diagnosis graphic” screen for making it possible to display waveforms observed at the occurrence of a servo or spindle alarm

In all of these features, the “Trouble diagnosis guidance” screen can be used to identify an alarm cause and how to handle it quickly, leading to a possible improvement in facility availability ratio due to a reduction of down time.

Shown below is an example of the “Trouble diagnosis guidance” screen.

Trouble diagnosis guidance screen

The failure diagnosis guidance executes a diagnosis flow to identify these causes. Many analyses are made automatically according to information inside of CNC. However, questions may be displayed on the guidance screen in making some analyses. Answer the questions using the soft key [YES] or [No] to proceed on the guidance flow.

NOTE

- “PROBABLE CAUSE” and “GUIDANCE” (how to handle) show the most likely information obtained. Before any replacement, make a double check using another method (for example, detecting an insulation resistance or checking conductivity).

2.2.1 Failure Diagnosis Guidance

IMPORTANT

- Using the failure diagnosis guidance requires keeping it in the “SAMPLING” status. See Subsection 2.2.3 for explanations about how to shift to the “SAMPLING” status.

Explained below is how to use the failure diagnosis guidance to identify the causes of alarm occurrence, using SV011 (“EXCESS ERROR (MOVING)”) and SV0449 (“SV IPM ALARM”) as examples.

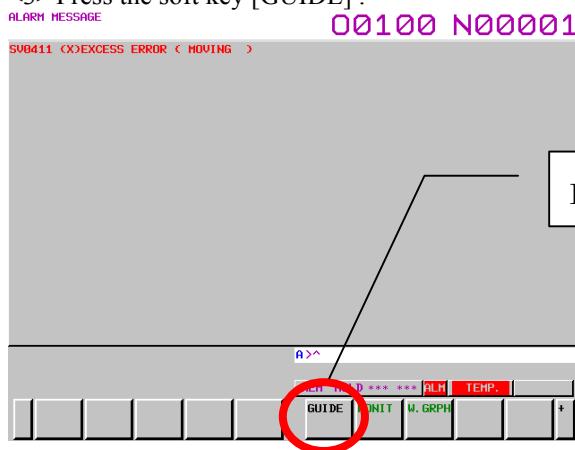

Alarm example 1) Occurrence of SV0411 (“EXCESS ERROR (MOVING)”)

- (1) At alarm occurrence, follow the steps below to display the “Trouble diagnosis guidance” screen.

<1> If no alarm screen appears, press the Message key.

<2> Keep pressing the continuation menu key [>] until the soft key [GUIDE] appears.

<3> Press the soft key [GUIDE].

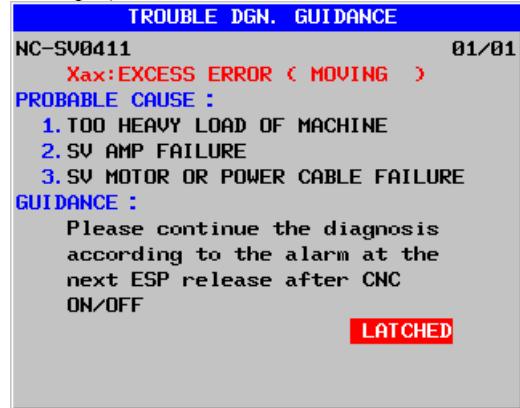

- (2) There are some causes to occur EXCESS ERROR as follows.

- Amplifier abnormal
- Power wire or motor winding short-circuited
- Power wire or motor winding broken
- Servo-off signal malfunctioning
- Excessive load fluctuation
- Brake faulty
- Command for speed higher than specification issued

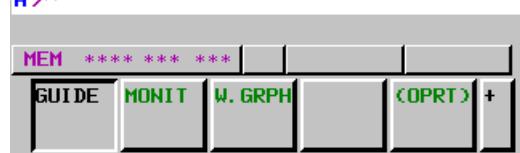

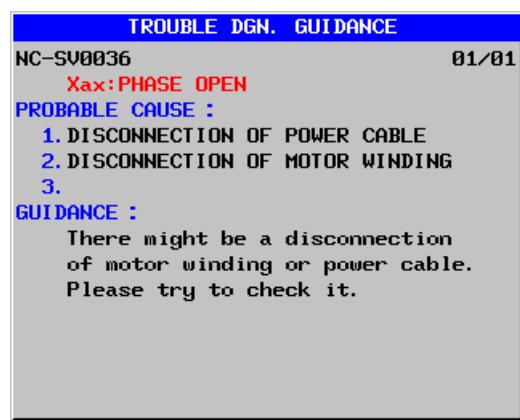

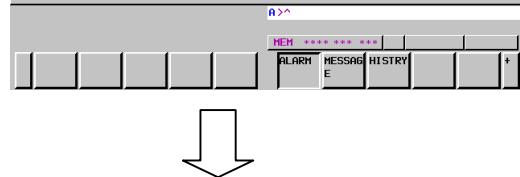

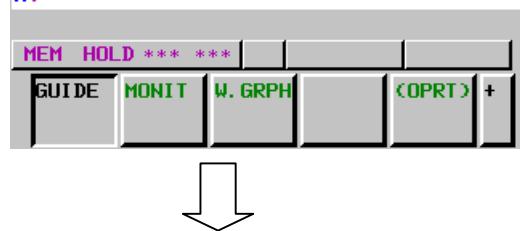

The failure diagnosis guidance executes a diagnosis flow to identify these causes. Many analyses are made automatically according to information within the NC. However, questions may be displayed on the guidance screen in making some analyses. Answer the questions using the soft key [YES] or [NO] to proceed on the guidance flow.

				TITLE	<i>αi</i> series SERVO AMPLIFIER for 30 <i>i</i> -B Start-up and Maintenance manual
					NO. B-65285EN/03-02/01
EDT.	DATE	DESIG.	DESCRIPTION	FANUC CORPORATION	
				PAGE	36 / 76

Example) "EXCESS ERROR (MOVING)" resulting from a broken power wire

Pressing [GUIDE] causes the message shown on the left to appear. The guidance requests you to turn off the power once. After the servo amplifier is turned off and on again, self-diagnosis is conducted.

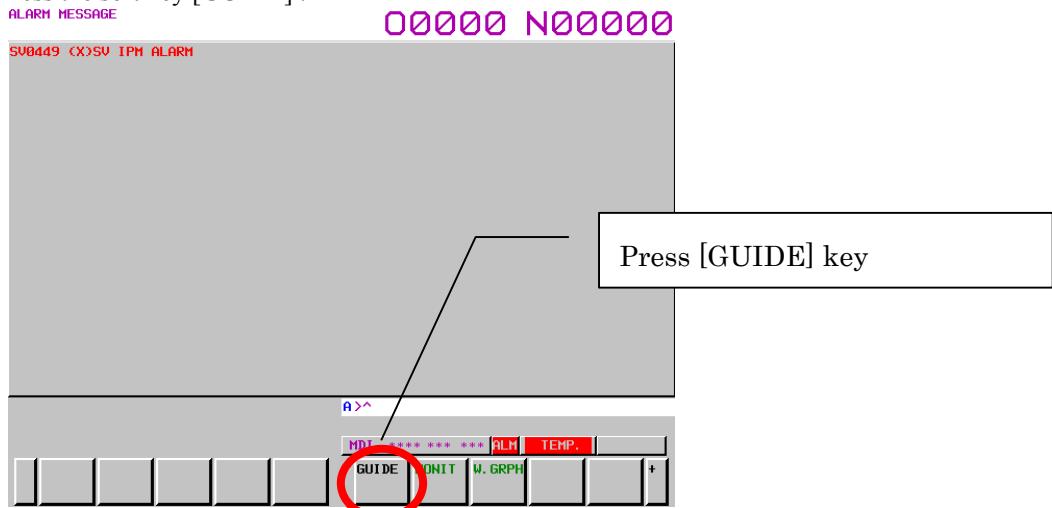

Just after the servo amplifier is turned on, self-diagnosis was conducted, and the “PHASE OPEN” alarm occurred. Press the [GUIDE] button again to display the “Trouble diagnosis guidance” screen.

The [Trouble diagnosis guidance] screen suggests a possible broken motor winding or power wire. Take action as directed by the message.

EDT.	DATE	DESIG.	DESCRIPTION	FANUC CORPORATION	PAGE	37 / 76

Alarm example 2) Occurrence of SV0449 ([SV IPM alarm])

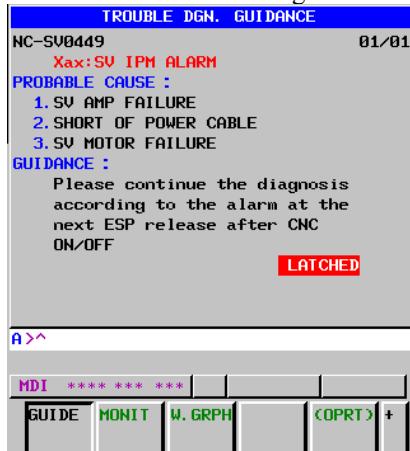

- (1) At alarm occurrence, follow the steps below to display the “Trouble diagnosis guidance” screen.
 - <1> If no alarm screen appears, press the Message key.
 - <2> Keep pressing the continuation menu key [>] until the soft key [GUIDE] appears.
 - <3> Press the soft key [GUIDE].

- (2) There are some causes to occur “SV IPM alarm” as follows.
 - Amplifier abnormal
 - Power wire or motor winding short-circuited
 - Power wire or motor winding broken
 - Current control disturbed

The failure diagnosis guidance executes a diagnosis flow to identify these causes. Many analyses are made automatically according to information within the NC. However, questions may be displayed on the guidance screen in making some analyses. Answer the questions using the soft key [YES] or [NO] to proceed on the guidance flow.

Example) “SV IPM alarm” resulting from a broken power wire

Pressing [GUIDE] causes the message shown on the left to appear. The guidance requests you to turn off the power once. After the servo amplifier is turned off and on again, self-diagnosis is conducted.

2.2.2 Failure Diagnosis Monitor

IMPORTANT

- The failure diagnosis monitor has two status, “SAMPLING” and “LATCHED”. If you want to monitor data at future alarm occurrence, perform “CLEAR”. If you want to save the conditions at past alarm occurrence, do not perform “CLEAR”. See Subsection 2.2.3 for detailed descriptions of this procedure.

The failure diagnosis monitor can display the following information.

Follow the steps below to display the “Trouble diagnosis monitor” screen.

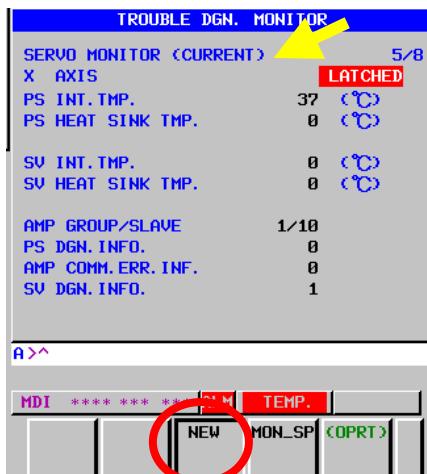

- Press the Message key to display the alarm screen.
- Keep pressing the continuation menu key [>] until the soft key [MONIT] appears.
- Press the soft key [MONIT] to display the “Trouble diagnosis monitor” screen.

Note

- 1 The range of displays listed above is only the one that can be displayed with the monitor function. It includes neither a system performance nor a rated value.
- 2 The parameter of maximum speed of motor should be set in order to display the speed command and actual speed.
 - No.4020 : Maximum speed of main spindle motor
 - No.4196 : Maximum speed of sub spindle motor motor (when the spindle switching control function is used)
- 3 The displayed voltage, current, frequency, resistance, and temperature values are approximate values with some error included. If accurate data is needed, measure them using dedicated measuring instruments.
- 4 SP data items 1 to 4 are intended for use by FANUC for maintenance purposes.
- 5 PS status flags 1 to 4 are intended for use by FANUC for maintenance purposes.
- 6 FSSB errors and jitter data indicate the status of FSSB communication. They are intended for use by FANUC for maintenance purposes.

2.2.3

How to set the Failure Diagnosis Guidance and Failure Diagnosis Monitor in the “SAMPLING” status

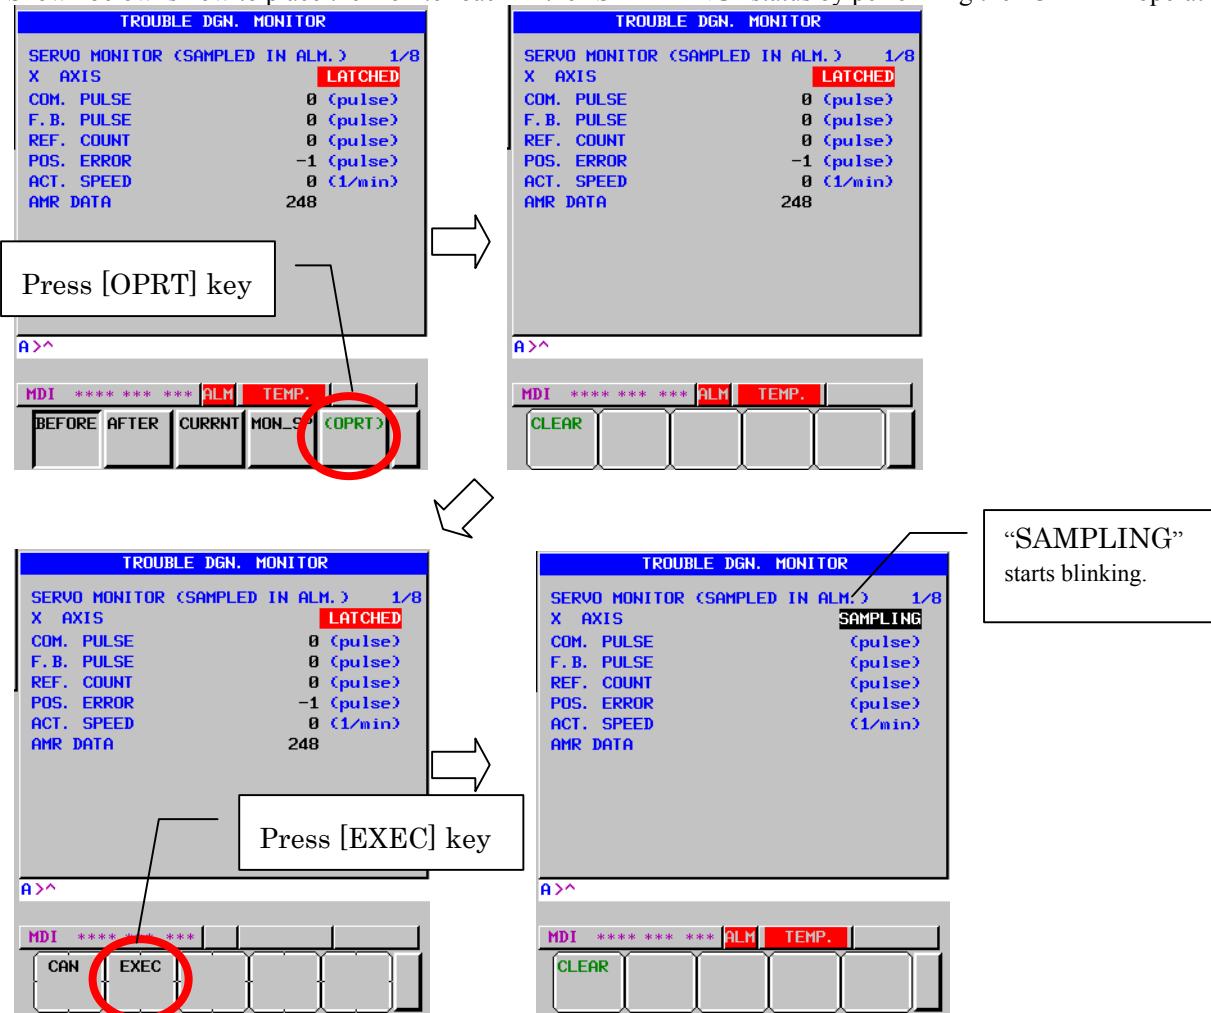

The failure diagnosis monitor has two statuses, “SAMPLING” and “LATCHED”.

The monitor is initially in the “SAMPLING” status. When an alarm occurs, it shifts to the “LATCHED” status. When the monitor is in the “LATCHED” status, performing the “CLEAR” operation erases the data saved at alarm occurrence and places it back to the “SAMPLING” status.

For this reason, observe the following:

- If it is necessary to monitor data at future alarm occurrence, perform the “CLEAR” operation.
- If it is necessary to save the statuses at past alarm occurrence, do not perform the “CLEAR” operation

Shown below is how to place the monitor back in the “SAMPLING” status by performing the “CLEAR” operation.

3. PERIODIC MAINTENANCE OF SERVO AMPLIFIER

3.1. PERIODIC MAINTENANCE ITEM

To use the servo amplifier for a long time and keep its high performance and reliability, you should perform maintenance and inspection on it routinely.

⚠ Note

- The methods of maintenance differ for the machine. Moreover, a scheduled inspection and fixed cleaning according to a user depending on a machine may be difficult. Please prepare the procedure which can perform a periodic maintenance and cleaning certainly after asking a machine maker about an unknown point.
- Please use a machine within the limits of the specification specified by a machine maker. When how to use besides specification is adopted, there is a possibility of shortening the life of servo amplifier or becoming the cause of an obstacle

Inspection target	Inspection item	Inspection cycle		Criterion
		Routine	Periodic	
Environment	Ambient temperature	<input type="radio"/>		Surroundings of the power magnetics cabinet: 0 to 45° C Inside of power magnetics cabinet: 0 to 55° C
	Humidity	<input type="radio"/>		90%RH or lower (no condensation allowed)
	Dust and Oil mist	<input type="radio"/>		No dust or oil mist shall be on and around the servo amplifier.
	Cooling air path	<input type="radio"/>		Whether the cooling air path is free from an obstacle. Whether the cooling fan motor is working.
	Abnormal vibration and noise	<input type="radio"/>		(1) There shall be no abnormal sound or vibration that has not been experienced so far. (2) Any vibration on and around the amplifier shall not be over 0.5 G.
	Power supply voltage	<input type="radio"/>		200V input model: 200 to 240 V. 400V input model: 400 to 240 V.
Amplifier	General	<input type="radio"/>		Whether there is dust or oil mist on the amplifier. Whether the amplifier generates abnormal sound or odor.
	Screw		<input type="radio"/>	There shall be no loose screw
	Fan motor (note 1) (note 2)	<input type="radio"/>		(1) The motor shall not generate abnormal vibration or sound. (2) There shall be no dust or oil mist on the motor.
	Connector		<input type="radio"/>	Whether there is a loose connector.
	Cable		<input type="radio"/>	1) Whether there is a sign of past heat generation. (2) Whether there is a deteriorated sheath (discolored or cracked).

				TITLE	<i>αi</i> series SERVO AMPLIFIER for 30 <i>i</i> -B Start-up and Maintenance manual	
					NO.	B-65285EN/03-02/01
EDT.	DATE	DESIG.	DESCRIPTION	FANUC CORPORATION		PAGE
						60 / 76

C N C	Battery for absolute pulsecoder (note 2)	<input type="radio"/>		The battery low alarm of an absolute pulse coder is not displayed on a mechanical control board or a screen.
External device	Magnetic contactor		<input type="radio"/>	The magnetic contactor shall not rattle or chatter.
	Ground fault interrupter		<input type="radio"/>	The interrupter shall be able to trip.
	AC reactor		<input type="radio"/>	There shall be no hum.

(note 1) Generally, fan motors are periodic-replacement parts.

If a fan motor for a servo amplifier does not work, the amplifier will not get broken immediately. However, you should inspect the fan motor constantly and replace it in a preventive manner.

(note 2) Since the fan motor and battery are periodic maintenance parts, Fanuc recommend preparation of spare parts.

				TITLE	<i>αi</i> series SERVO AMPLIFIER for 30 <i>i</i> -B Start-up and Maintenance manual

					61 / 76

3.2. INSULATION DETERIORATION DETECTION FUNCTION

The αi servo amplifier for the 30*i*-B series includes an insulation deterioration detection function, which can detect a sign of insulation deterioration in motor windings and power wires automatically and accurately. This function can use the voltage charged in the servo amplifier DC link to measure automatically the insulation resistance between the motor or power cable and a ground immediately after the servo amplifier has shifted from a servo-on state to an emergency stop state, thereby checking for insulation deterioration. If an insulation resistance of 10 MΩ or below is detected, a warning is issued.

3.2.1 How to Use

- (1) To use the insulation deterioration detection function, set the parameters listed below.

	Parameter No.	Enabling/disabling the function (axis by axis)
Servo amplifier	No2429#0	0: Disable for SV (default)/1: Enable for SV
Spindle amplifier	No4549#0	0: Disable for SP (default)/1: Enable for SP

- (2) Measuring the insulation resistance requires charging the DC link voltage. So, keep the amplifier released from an emergency stop for at least 5 seconds before measurement. This is unnecessary when the machine is working normally before measurement.
- (3) The measurement of insulation resistance start by inputting the emergency stop(*ESP) to connector CX4 of common power supply (PS) after the DC link voltage is charged.

3.2.2 How to Check

- (1) If insulation deterioration is detected, “LKG” in the lower section of the CNC screen blinks.
- (2) Measurement results can be viewed on the “LEAKAGE DETECTION MONITOR” screen of the CNC.

3.2.3 Action

If insulation deterioration is detected, measure the insulation resistance of motor and power cables separately with a megohmmeter to see which has a deteriorated insulation, the motor or power cable. Then, replace the motor or power cable whichever is relevant.

				TITLE	αi series SERVO AMPLIFIER for 30 <i>i</i> -B Start-up and Maintenance manual	
					NO.	B-65285EN/03-02/01
EDT.	DATE	DESIG.	DESCRIPTION	FANUC CORPORATION		PAGE
						62 / 76

3.2.4 Other Notes

- (1) No insulation resistance is measured in the following cases:
 - The servo amplifier enters an emergency stop state again before entering a ready state.
 - The servo amplifier is released from an emergency stop state during insulation deterioration checks.
- (2) Continuing a long-term operation with insulation deteriorated may cause the machine to stop because of the ground fault interrupter tripping or an alarm occurring. If insulation deterioration is detected, replace the relevant motor or power cable as soon as possible.
- (3) No accurate measurement can be made while the motor is running. So, no measurement will be made even in an emergency stop state, for example, if the spindle motor is rotating through inertia.

WARNING

Insulation resistance measurement starts when the emergency stop signal (*ESP) applied to the connector CX4 of the common power supply (PS) represents an emergency stop state. During insulation resistance measurement, the voltage charged in the DC link is applied to the motor. Do not touch the motor during measurement to avoid getting electrical shocks. Insulation resistance measurement begins 6 seconds after the emergency stop state has been entered.

3.3. How to replace the battery for the absolute Pulsecoder

3.3.1 Outline

- When the voltage of the batteries for absolute Pulsecoders becomes low, alarm 307 or 306 occurs, with the following indication in the CNC state display at the bottom of the CNC screen.
 - Alarm 307 (alarm indicating the voltage of the battery becomes low) :
The indication "APC" blinks in reversed display.
 - Alarm 306 (battery zero alarm) :
The indication "ALM" blinks in reversed display.
- When alarm 307 (alarm indicating the voltage of the battery becomes low) occurs, replace the battery as soon as possible. In general, the battery should be replaced within one or two weeks, however, this depends on the number of Pulsecoders used.
- When alarm 306 (battery zero alarm) occurs, Pulsecoders are reset to the initial state, in which absolute positions are not held. Alarm 300 (reference position return request alarm) also occurs, indicating that reference position return is required.
- In general, replace the batteries periodically within the service life listed below.
 - A06B-6050-K061 or D-size alkaline dry cells (LR20) : Two years (for each six-axis configuration)
 - A06B-6073-K001 : Two years (for each three-axis configuration)
 - A06B-6114-K504 : One year (for each three-axis configuration)

NOTE

The above values indicate the estimated service life of batteries used with FANUC absolute Pulsecoders. The actual battery service life depends on the machine configuration based on, for example, detector types. For details, contact the machine tool builder.

3.3.2 Replacing procedure of the battery

To prevent absolute position information in absolute Pulsecoders from being lost, turn on the machine power before replacing the battery. The replacement procedure is described below.

- <1> Ensure that the power to the servo amplifier is turned on.
- <2> Ensure that the machine is in the emergency stop state (the motor is inactive).
- <3> Ensure that the DC link charge LED of the servo amplifier is off.
- <4> Detach the old batteries and attach new ones.

				TITLE	<i>αi</i> series SERVO AMPLIFIER for 30 <i>i</i> -B Start-up and Maintenance manual
				NO.	B-65285EN/03-02/01
EDT.	DATE	DESIG.	DESCRIPTION	FANUC CORPORATION	PAGE
					64 / 76

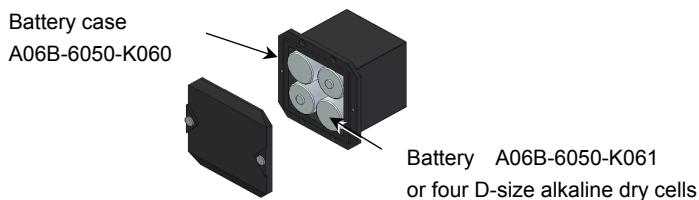

⚠️WARNING

- The absolute Pulsecoder of each of the αiF , αiS series servo motors and the $\beta \beta iS$ series servo motors ($\beta iS0.4$ to $\beta iS22$) has a built-in backup capacitor. Therefore, even when the power to the servo amplifier is off and the batteries are replaced, reference position return is not required if the replacement completes within less than 10 minutes. Turn the power on and replace the batteries if the replacement will take 10 minutes or more.
- To prevent electric shock, be careful not to touch metal parts in the power magnetics cabinet when replacing the batteries.
- Because the servo amplifier uses a large-capacitance electrolytic capacitor internally, the servo amplifier remains charged for a while even after the power is turned off. Before touching the servo amplifier for maintenance or other purposes, ensure your safety by measuring the residual voltage in the DC link with a tester and confirming that the charge indication LED (red) is off.
- Be sure to replace the batteries with specified ones. Pay attention to the battery polarity. If a wrong type of battery is used or a battery is installed with incorrect polarity, the battery may overheat, blow out, or catch fire, or the absolute position information in the absolute Pulsecoders may be lost.
- Ensure that the battery connector is inserted in the correct position.

3.3.3 How to insert batteries into the battery case

Use the following procedure to replace the batteries in the battery case.

- <1> Loosen the screws on the battery case and detach the cover.
- <2> Replace the batteries in the case (pay attention to the polarity).
- <3> Attach the cover to the battery case.

⚠️ CAUTION

- Four D-size alkaline dry cells (LR20) that are commercially available can be used as batteries. A set of four A06B-6050-K061 batteries is optionally available from FANUC.
- Replace all the four batteries with new ones. If old and new batteries are mixed, the absolute position information in the absolute Pulsecoders may be lost.

3.3.4 How to replace the built-in lithium battery

Use the following procedure to replace the lithium battery.

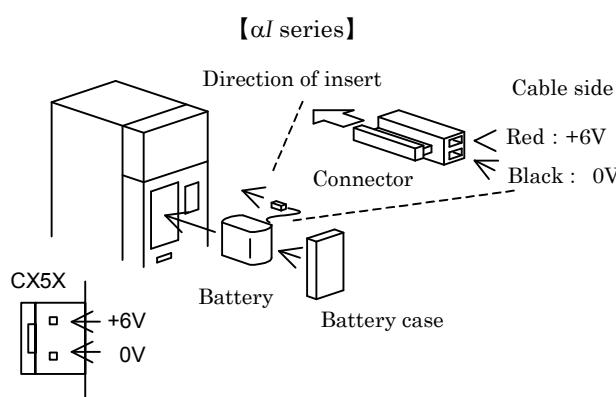

- <1> Remove the battery cover.
- <2> Install the lithium battery.
- <3> Install the battery cover.

				TITLE	αi series SERVO AMPLIFIER for 30 <i>i</i> -B Start-up and Maintenance manual	
					NO.	B-65285EN/03-02/01
EDT.	DATE	DESIG.	DESCRIPTION	FANUC CORPORATION		PAGE
65 / 76						

! CUATION

- Since a battery is not a commercial item, please be sure to purchase it from Fanuc. Therefore, Fanuc recommend preparation of the spare battery.
- When using the built-in batteries, do not connect them to the BATL (B3) of connector CXA2A/CXA2B. The output voltages from different SV batteries may be short-circuited, resulting in the batteries becoming very hot.
- If it is attached where a battery cable is stretched, loose connection etc. may occur.
- When +6V of CX 5X and 0V short-circuit, it becomes the cause of generation of heat of the battery, a burst, ignition, and the absolute position information disappearance in an absolute pulse coder.
- In case you insert a connector, please insert horizontally to the direction of the pin of the connector.

[Connection method of battery]

The battery is installed in the front of servo amplifier

[Combination and outline of the battery]

Battery Specification No.	Type	Servo amplifier	Battery case Specification No.	Outline
A06B-6114-K504 (note)	BR-2/3AGCT4 A (Panasonic)	<i>αi</i> series 60/90mm width	A06B-6114-K50 5	
		<i>αi</i> series 150/300mm width	A06B-6114-K50 6	

(note) When old type battery BR-CCF2TH(A06B-6073-K001) is used, please order battery case A06B-6114-K500.

About a used battery

Please dispose correctly as "industrial waste" about the battery after exchange according to the law which the country in which the machine was installed.

4. MAINTENANCE PARTS AND REPLACEMENT METHODS

4.1. HOW TO REPLACE FAN MOTORS

4.1.1 How to Detach Fan Units from 60 and 90 mm Width Units

- (1) Holding the two lugs on the fan unit, lift the internal cooling fan unit upward. (Removal of internal cooling fan unit is completed.)
- (2) The lock of DC link terminal cover is released, and DC link terminal cover is opened. And discharge of DC link (LED has gone out) is checked, and DC link short bar is removed.
- (3) From the hole beside DC link terminal, the screw driver is inserted and the lower screw (one place) of the radiator cooling fan unit is loosened.
- (4) The upper screw (60mm wide is one place and 90mm wide is two places) of the radiator cooling fan unit is loosened.
- (5) The radiator cooling fan unit is pulled out to the front. (Removal of radiator cooling fan unit is completed.)
- (6) When it mounts, the fan unit is mounted in the reverse procedure.

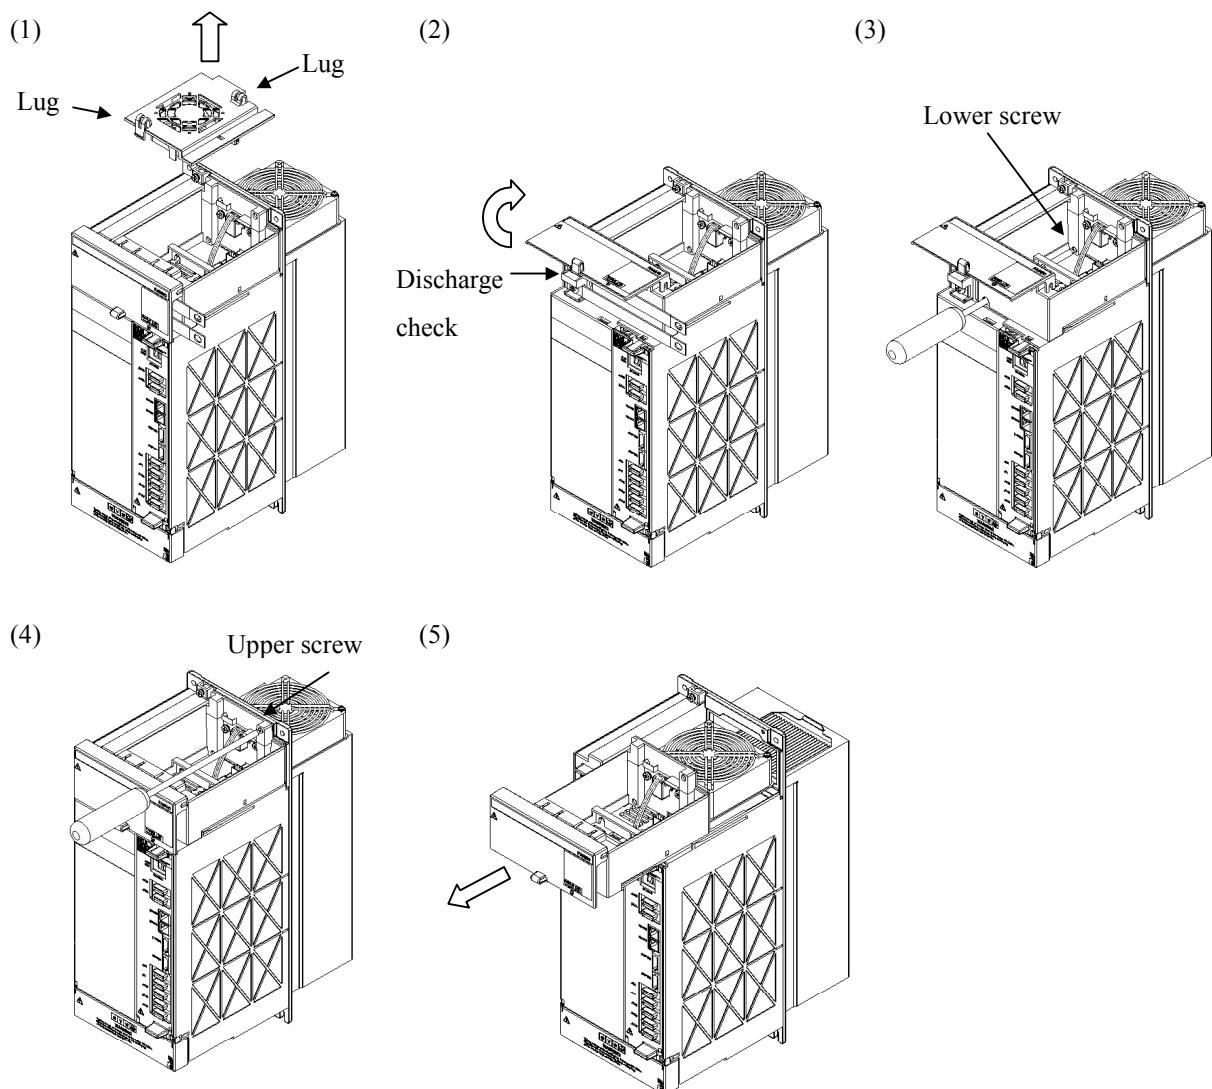

Note) The connector may be hard to fit in at the time of mounting of the internal fan unit. In that case, please mount, pushing the lug by the side of the back of the internal fan unit to the left.

4.1.3 How to Detach the Fan Motor from the Internal Cooling Fan Unit

- (1) The connector (one place or two places) is removed from the case. (Refer to the following figure for details.)
- (2) The fan motor is removed from the case.

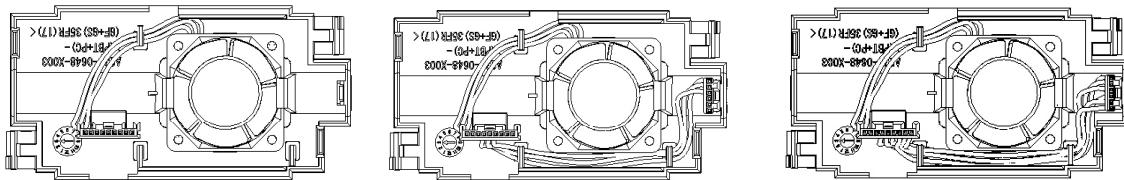

By twisting lightly in the direction of the arrow, resin on either side is bent and the central latch separates.

The connector separates from the case by drawing out to the up side, twisting the connector.

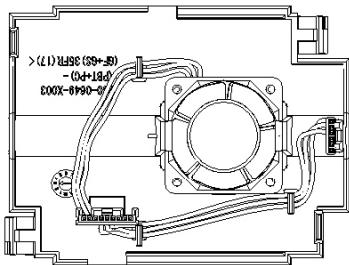

- The internal cooling fan unit for 60mm width model

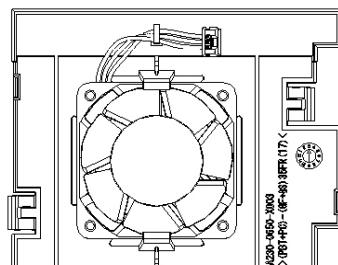

(There are three kinds of fan units distinguished with connector composition.)

The internal cooling fan unit for 90mm width model

The internal cooling fan unit for 150mm width model

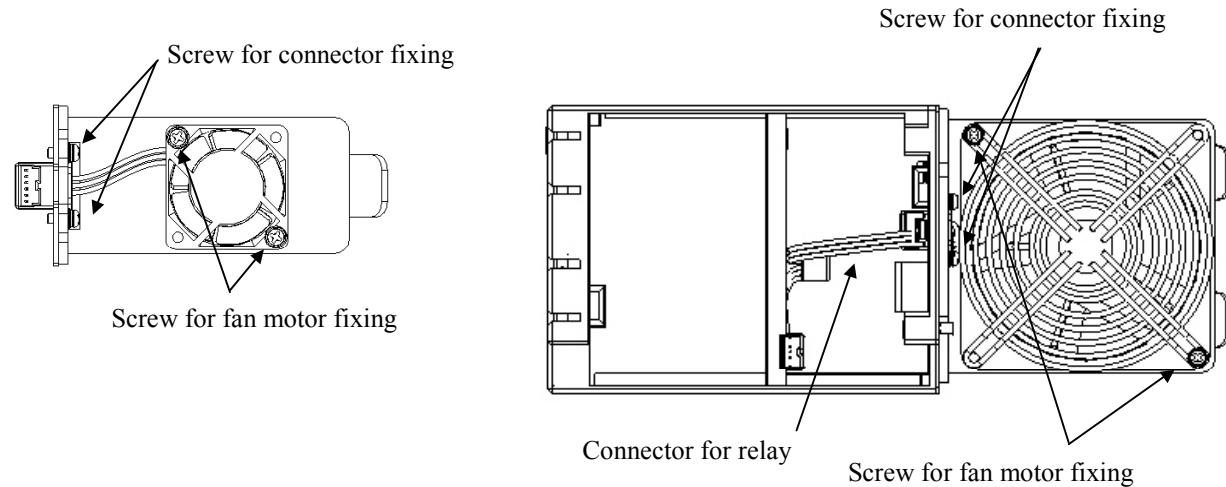

Be careful of direction (when mounted in amplifier, the label turns to a top.) of a fan motor, and direction of a connector at the time of fan motor exchange.

4.1.4 How to Detach the Fan Motor from the Head Sink Cooling Fan Unit

- (1) In the case of the fan unit for 150mm width and 300mm width, the relay connector is removed from the connector of the fan motor. (There is no connector for relay in the fan unit for 60mm and 90mm wide.)
- (2) Two or four screws which are fixing the fan motor are removed.
- (3) Two screws which are fixing the connector of a fan motor are removed.

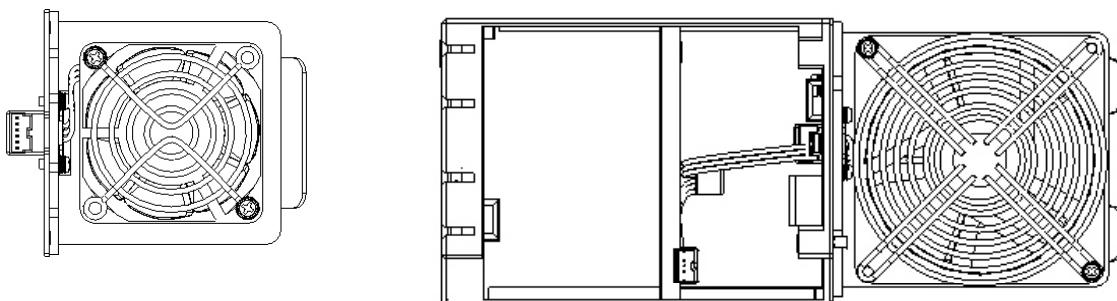

The radiator cooling fan unit for 60mm width model

(There are two kinds of fan units distinguished by the number of fan motors.)

The radiator cooling fan unit for 90mm width model The radiator cooling fan unit for 150mm width model

Be careful of direction (when mounted in amplifier, the label turns to a top.) of a fan motor, and direction of a connector at the time of fan motor exchange.

4.2. HOW TO REPLACE FUSES ON PRINTED-CIRCUIT BOARDS

In the αi series, a printed-circuit board can be removed and inserted from the front of the servo amplifier. The printed-circuit board removal/insertion procedure is common to the PS, SV, and SP.

Note

1. When the fuse is blown, the cause by the power supply short circuit of other apparatus (sensor etc.) connected to servo amplifier can be considered.
Please exchange the fuse after a check whether other apparatus is normal.
If the cause is not removed, there is a possibility that the fuse will be blown again.
2. Please use the fuse supplied from FANUC.
3. Please check the rating mark on the PCB and seal of the fuse to prevent mistakes.

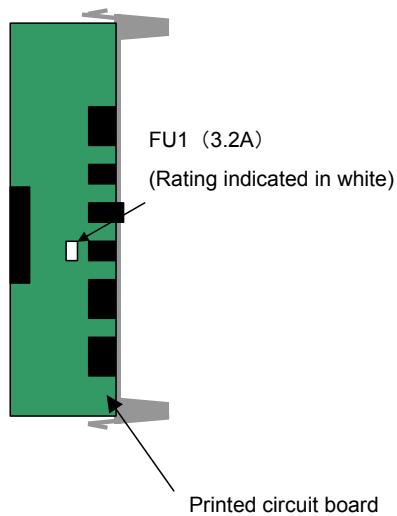

To insert the printed-circuit board, reverse the above procedure.
Ensure that the upper and lower hooks snap into the housing.
If the printed-circuit board is not inserted completely, the housing remains lifted. Pull out the printed-circuit board and insert it again.
